Freight Tracking

Using the freight tracking APIs, you can update create, update, or notify freight tracking processes when integrating SAP Business Network for Logistics with external systems.

You can perform the following activities using the APIs for freight booking:

- You can use the Provider API to Create or Update Track Process to create a freight order for tracking in SAP Business Network for Logistics.
- You can use the Consumer API to Notify Events to update a freight order with event information in your transportation management system.

More Information

Track Freight Movement

Provider API to Create or Update Track Process

As a shipper, you can create a freight order for tracking in SAP Business Network for Logistics.

Technical Name

`TransportationOrderGenericTrackedProcessRequest_Out`

Description

You can use this inbound service provided by SAP Business Network for Logistics to create a freight order for tracking from your external system, such as a transportation management system. This will enable you to track a freight order.

Structure

For more information, see the following SAP Note: 2742948.

Consumer API to Notify Events

As a shipper, you can update a freight order with event information in your transportation management system.

Technical Name

`TransportationEventBulkNotification_In`

Description

You can use this outbound service consumed by SAP Business Network for Logistics to update the event information for a freight order in your external system, such as a transportation management system. The event information is received either from a carrier or a network partner.

Structure

For more information, see the following SAP Note: 2742948.

Freight Settlement

Using the freight settlement API, you can perform freight settlement with your ordering party.

You can perform the following activities using the APIs for freight settlement:

- You can use the Provider API to Confirm Freight Order Dispute Charges to confirm an update of freight order charges in SAP Business Network for Logistics after dispute resolution.

- You can use the Consumer API to Update Freight Order with Dispute Charges to update dispute charges on a freight order in your transportation management system.
- You can use the Provider API to Create Freight Order for Settlement to create a freight order for settlement in SAP Business Network for Logistics.
- You can use the Consumer API to Create Invoice to create an invoice in your transportation management system.

Provider API to Create Freight Order for Settlement

As a shipper, you can create a freight order for settlement in SAP Business Network for Logistics.

Technical Name

`TransportationOrderRequest_Out`

Description

You can use this inbound service provided by SAP Business Network for Logistics to create a freight order for settlement from your external system, such as a transportation management system. This request will be presented to your carriers.

Note that SAP Business Network for Logistics accepts only 700 items in a freight order for settlement document.

Structure

For more information, see: Request Transportation Order

Provider API to Create Freight Booking for Settlement

As a shipper, you can create or update a freight booking for settlement in SAP Business Network for Logistics.

Technical Name

`BNTransportationOrderChargeElementRequest_Out`

Description

You can use this inbound service provided by SAP Business Network for Logistics to create a freight booking for settlement from your external system, such as a transportation management system. This request will be presented to your carriers.

Note that SAP Business Network for Logistics accepts only 700 items in a freight order for settlement document.

Consumer API to Create Invoice

As a shipper, you can create an invoice in your transportation management system.

Technical Name

`InvoiceRequest_In`

Description

You can use this outbound service consumed by SAP Business Network for Logistics to create an invoice for a freight order in your external system, such as a transportation management system. The invoice is submitted by your carrier.

Structure

For more information, see: InvoiceRequest_In - Invoice

Provider API to Confirm Freight Order Dispute Charges

As a shipper, you can confirm an update of freight order charges in SAP Business Network for Logistics after dispute resolution.

Technical Name

`TransportationOrderChargeElementConfirmation_Out`

Description

You can use this inbound service provided by SAP Business Network for Logistics to confirm an update of freight order charges after you as a shipper have accepted the disputed charges. This call is in response of the `Consumer API to Update Freight Order with Dispute Charges`.

Structure

For more information, see the following SAP Note: 2833645.

Consumer API to Update Freight Order with Dispute Charges

As a shipper, you can update dispute charges on a freight order in your transportation management system.

Technical Name

`TransportationOrderChargeElementRequest_In`

Description

You can use this outbound service consumed by SAP Business Network for Logistics to update a freight order in your external system, such as a transportation management system, with charges agreed after a dispute with your carrier.

Structure

For more information, see the following SAP Note: 2833645.

Provider API to Create or Update Dispute

As a shipper, you can use this interface to create or update a dispute case in your SAP Business Network for Logistics system.
