Deletion of Personal Data

Simplified Blocking and Deletion

The processing of personal data is subject to applicable laws related to the deletion of this data when the specified, explicit, and legitimate purpose for processing this personal data has expired. If there is no longer a legitimate purpose, that requires the retention and use of personal data, it must be deleted irrecoverably. Blocking is necessary when the original retention period has expired but additional applicable extended and overruling (mandated by law) retention periods are still in place. After the expiration of the longest retention period, the data must be deleted.

Deletion of Personal Data

When considering compliance with data protection regulations, it is also necessary to consider compliance with industry-specific legislation in different countries. A typical potential scenario in certain countries is that personal data shall be deleted after the specified, explicit, and legitimate purpose for the processing of personal data has ended, but only if no other retention periods are defined in legislation, for example, retention periods for financial documents. Legal requirements in certain scenarios or countries also often require blocking of data in cases where the specified, explicit, and legitimate purposes for the processing of this data have ended, however, the data still has to be retained in the database due to other legally mandated retention periods. Sometimes, transactional data are personal data with relation to a master data object, e.g. a sales order with reference to a business partner. Therefore, the challenge for deletion and blocking is first to handle transactional data and finally other data, such as business partner data.

Deletion of Personal Data in the SAP Business Network for Logistics

The administrator of a company can specify retention periods using the **Retention Management** app.

For more information, see Retention Management.

Once the residence period ends, the data moves to the blocking period. In the blocking period, only users with special privileges, such as a data protection officer, can access the data. At the end of the configured blocking period, the system deletes the data. The data protection officer can use the **Blocking Store** app provided by SAP Business Network for Logistics to access all the documents that are in the blocking period. To view a document, the user can download the document in a text file format.

For more information, see Blocking Store.

Change Log

Creation and change of personal data need to be documented. Therefore, for review purposes or as a result of legal regulations, it may be necessary to track the changes made to this data. When these changes are logged, you should be able to check which user made which change, the date and time, the previous value, and the current value, depending on the configuration. Furthermore, log records can be viewed and queried, but access to them is restricted by adequate authorizations. The personal data for which changes shall be logged and the retention period of logs, can be configured..

Change Logging in the SAP Business Network for Logistics

SAP Business Network for Logistics supports change and audit log. When you change any personal information, the system updates the audit log. Users with the required authorization can request for the change log.

To request for a log, the authorized user must create an SAP support message in the component `BC-NEO-AUDITLOG`. For more information about how to request for audit logs, see Audit Log Viewer for the Cloud Foundry Environment.

Products built using Java with an SAP HANA database as a back end use the audit trails and audit policies for change logging. For more information, see the Auditing Activity section in the SAP HANA Security Guide.

This product uses the Log4J API for change logging. For more information, see JDBC Appender .

This product uses a log façade for change logging. For more information, see the Appenders section of the Logback documentation .

Java-based NetWeaver products use the security audit log of the SAP NetWeaver Application Server (AS) Java for change logging. For more information, see the Security Audit Log of the AS Java.

Cloud products using SAP HANA XS and SAP HANA standalone use the audit trail and audit policies for change logging. For more information, see the Auditing Activity section in the SAP HANA Security Guide.

Monitoring and Troubleshooting

Error Handling

If you encounter technical issues or require support, follow the procedure to report a case.

Report a Case through SAP for Me

To report a case through SAP for Me, you need an S-User ID to sign in. If you don't have the sign-in credentials of your S-User, contact a user administrator in your organization. If you have trouble identifying who the user administrator is in your organization, please call the Customer Interaction Center (CIC).

For more information, see the SAP for Me Online Help under Access and Authorizations.

Procedure

1. Open the SAP for Me application. Sign in with your S-User ID.
2. Navigate to **Services & Support** > **Get Support**.
3. In the **Get Support** app, select a relevant customer and report your issue. For detailed process, see Get Support Application Online Help.

   If you use a component to categorize your issue, use SBN-LBN.

Report a Case on Ariba Help Center

If you set up your logistics provider account via the simplified onboarding process, you won't have an S-User ID. In this case, you can report a case on Ariba Help Center.

Procedure

1. Sign in to Ariba Help Center then choose **Carrier Help Center**.
2. Select **Contact us**, enter keywords pertaining to the issue in the search box and then press **Enter**.
3. Browse the populated results. If the results provided do not resolve your issue, click **Create a Case** at the lower-right corner.
4. Enter information on the case creation form.

Note

- Select the solution or add-on you're using from the **Issue type** dropdown list, then choose the most relevant **Issue area**.
- Enter your company's Business Network ID (BNO ID) in the **Account ID** field.

5. Click **One last step** once you complete the case creation form, choose the contact method, and then click **Submit**.

After you create a case on the Ariba Help Center, our support team will contact you using the email address you provided in the case creation form. We recommend adding itsm.notification-service@sap.com to your mailbox's allowed senders list to ensure you receive all correspondence.

Accessibility Features

To optimize your experience, our apps have features and settings that help you use the software efficiently. Learn more about these features and settings and find out how to use them.

Note

SAP Business Network for Logistics is based on SAPUI5. For this reason, accessibility features for SAPUI5 also apply. See the accessibility documentation for SAPUI5 on SAP Help Portal at Accessibility for End Users.

For more information on screen reader support and keyboard shortcuts, see Screen-Reader Support for SAPUI5 Controls and Keyboard Handling for SAPUI5 Elements.
