Note: For customers using an intermediate integration platform, such as SAP PI/PO, or SAP Cloud Integration, they need to update the destination URL and client certificate detail in the respective places.

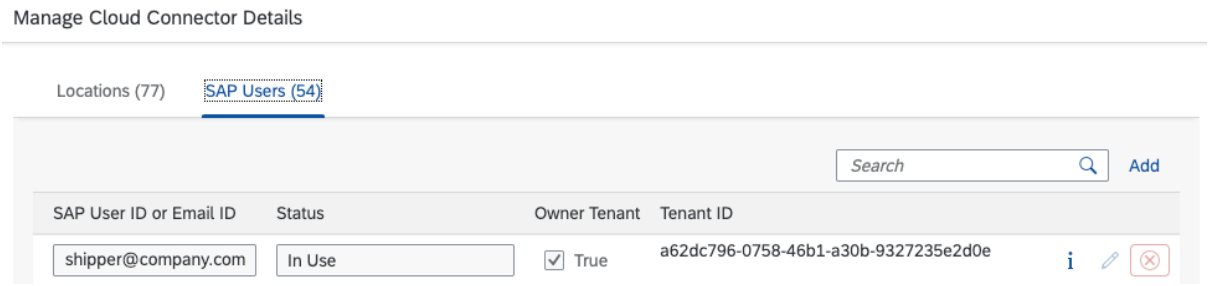

- In SAP Business Network for Logistics, you must create a new connection in your System Connections app. **Your old connections stay as they are**. You can continue to edit the existing connections. There is a differentiator in the UI to help you identify between old and new connection types. For old connections, a banner is present – 'This connection's integration platform has been deprecated'. Any new connection created in the System Connections app since the release will point to the new integration platform. You won't be able to create new connections in the System Connections app that point to the older platform.

Outbound from SAP Business Network for Logistics

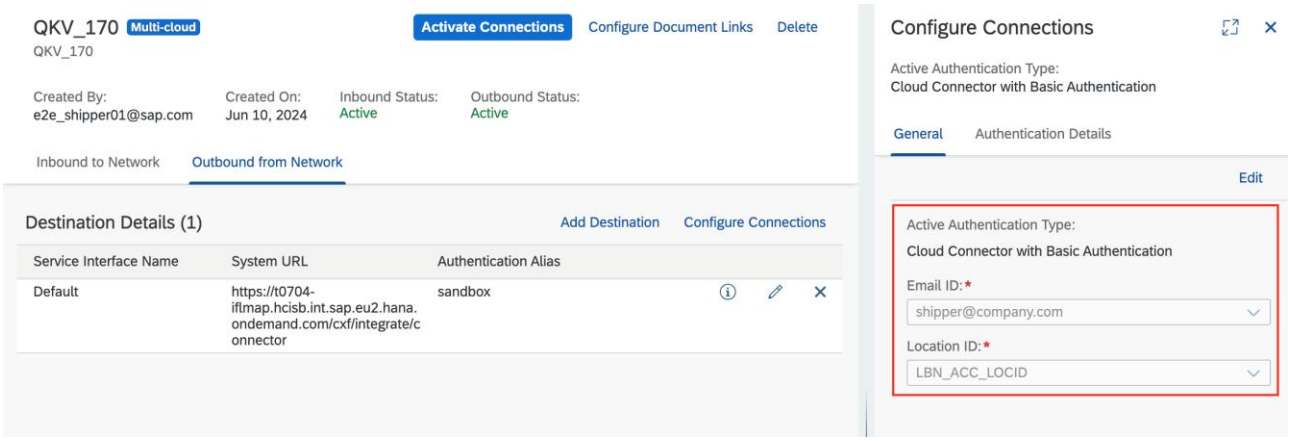

- In the System Connections app, open 'Manage Cloud Connector Details'. Maintain a new cloud connector location ID and an email ID. You need to add the new integration platform's sub-account in your SAP Cloud Connector configuration. To add the new platform in your SAP Cloud Connector, the authentication is enabled via email ID instead of S-User ID. This is the email linked to your S-User in the SAP ID service.

The existing location ID must not be re-used, and a new location ID must be added. This is because the existing connection should remain as mentioned before.

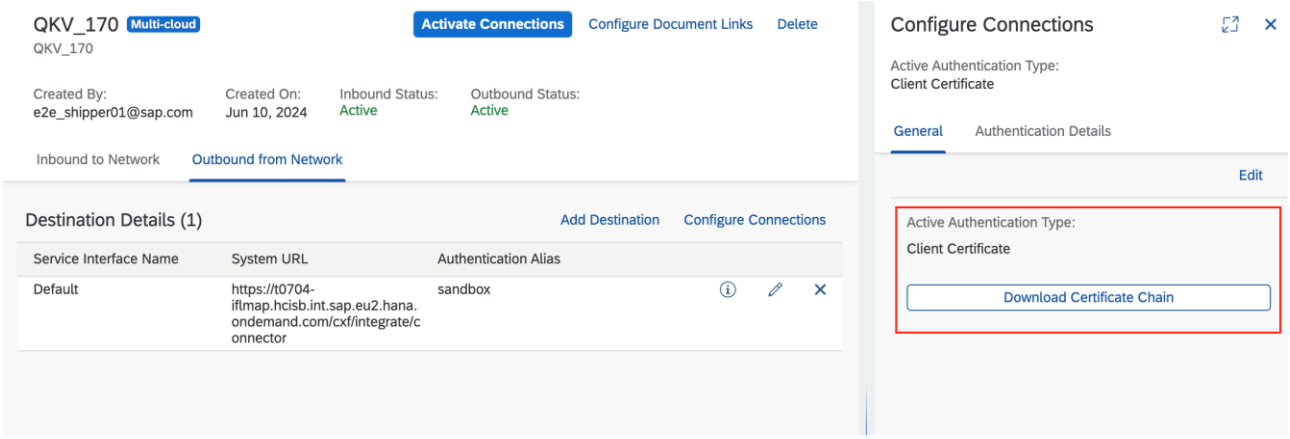

- In the 'Outbound from Network' tab, maintain the backend system URL for service interfaces.
- In the 'Configure Connections' tab, maintain the 'Active Authentication Type'.
  - If you choose 'Cloud Connector with Basic Authentication', maintain the location ID and email ID that you configured above.

  - If you choose 'Client Certificate', please note that the certificate chains are different for the old platform and the new one. 'Download Certificate Chain' will contextually download the old/new certificate chain

depending on which connection you've chosen. Make sure that you download from the new connection and use the same for your Outbound from Network authentication.

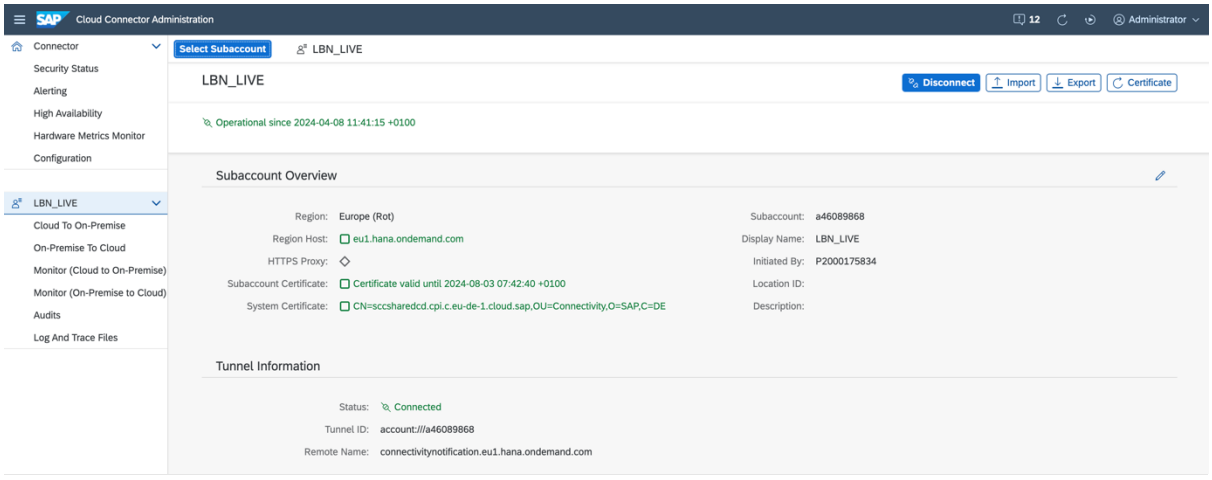

This certificate must be configured in your intermediate cloud integration system (for example: SAP Cloud Integration) for authenticating the calls from SAP Business Network for Logistics to your integration system.

- Changes in your Cloud Connector tenant

  If you are directly connecting to your ABAP backend systems from SAP Business Network for Logistics, you need to add the new SAP Cloud Integration sub-account in your cloud connector. The existing connection that you created refers to the old integration tenant and you need to re-do the process for the new platform as well. Please note that the old configuration in your SAP Cloud Connector tenant must not be changed/deleted as it's required for the execution of existing documents.

  Your existing connection will remain as-is:

Additionally, you need to add the new SAP Business Network for Logistics integration subaccount as well.

– For customers in EU10 data center, the configuration is as below:

© 2024 SAP SE or an SAP affiliate company. All rights reserved. See Legal Notice on www.sap.com/legal-notice for use terms, disclaimers, disclosures, or restrictions related to this material.

Region: Europe (Frankfurt) - AWS

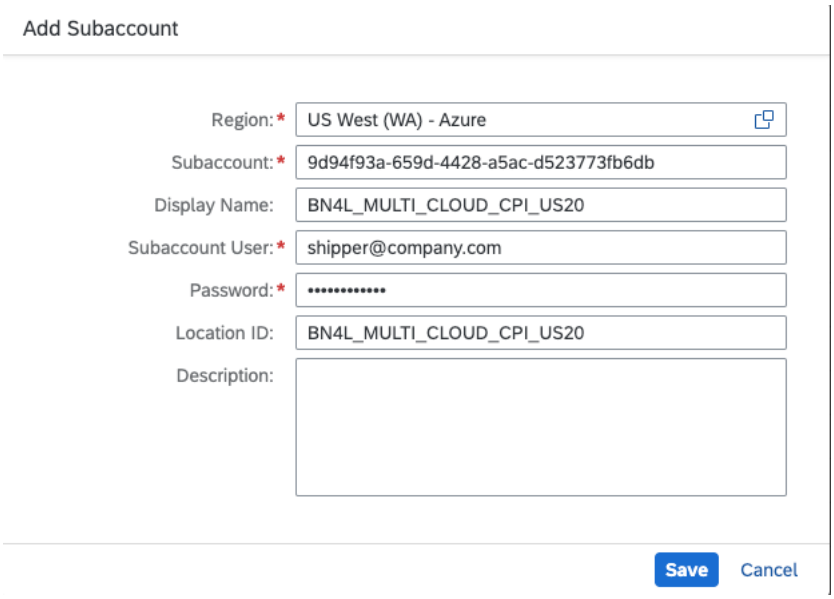

Subaccount: 519bb3be-97e0-42bc-a0bd-28e11b695c12

Subaccount User: Email ID as mentioned in System Connections app

Password: Linked to your S-User (Access to SAP ID Service/SAP Support Portal)

Location ID: As specified in the System Connections app

– For customers in US20 data center, the configuration is as below:

Region: US West (WA)

Subaccount: 9d94f93a-659d-4428-a5ac-d523773fb6db

Subaccount User: Email ID as mentioned in the System Connections app

Password: Linked to your S-User (Access to SAP ID Service/SAP Support Portal)

Location ID: Location ID as specified above

Important Note: You should always add the above-mentioned sub-account in your cloud connector. Customers often get confused with this step and add their provisioned tenant in SAP Business Network for Logistics. The integration is happening via SAP-managed integration platform and your backend system. Hence to establish a secure connection in your SAP Cloud Connector, you should add the above sub-accounts in your cloud connector.

- If you're not using a direct connection to an SAP landscape, you don't need to do the SAP Cloud Connector configurations. However, you might need to additionally allowlist new IP ranges to accommodate the calls coming from the new integration platform.

Monitoring of Integration Logs

The Manage Integration Logs app in your tenant is updated to support the integration logs from both, the old 'neo' and the new 'multi-cloud' integration platform. We've also added a new column to make this clear to customers. The app also supports the reprocessing of messages failed/escalated in both these platforms.

Test Case for Smoke Testing

- SAP S/4HANA backend to Network – Once the configuration changes are done, check if the messages have been received in your shipper tenant. You should be able to see these messages in the Manage Integration Logs app as well.
  - For example: In your SAP S/4HANA system, open a Road Freight Order.
  - Send the freight order to SAP Business Network for Logistics by Subcontracting -> Send to Carrier.
  - Check if the Freight Order is created in the carrier's Freight Order for Confirmation app in SAP Business Network for Logistics.
- Network to SAP S/4HANA – For any outbound from SAP Business Network for Logistics, check if the confirmation messages have been received successfully in your SAP S/4HANA backend and if the log is visible in your Manage Integration Logs app.
  - For example: Confirm the Freight Order created in the previous step from your carrier app.
  - Check if the Freight Order status is updated in your backend SAP S/4HANA system.
- In case of any failures, please check the integration logs in your SRT_MONI/SXI_MONI transactions in the SAP S/4HANA backend, integration logs in your intermediate cloud integration platform (if any) and Manage Integration Logs in SAP Business Network for Logistics in the respective order.

Other Configurations Apps

No changes are needed from customer side for other configuration apps such as:

- Configure Partner Connections
- Assign Codes

Configurations maintained in these apps will be moved to the new integration platform and no inputs are required from the customer.

Support

If you encounter any issues during the migration process, refer to the following blog article. This article summarizes frequently asked questions about the migration:

https://community.sap.com/t5/supply-chain-management-blogs-by-sap/faq-neo-to-multi-cloud-cpi-migration-for-business-network-for-logistics/ba-p/14079631

For any further queries, open a 'Medium' priority incident in the 'SBN-LBN-INT' component with the title – 'Concerns related to SAP BN4L integration platform migration – <CustomerName>'.
