You can report an unplanned event as follows:

1. Select an event from the supported event types.
2. Optionally, select a stop at which this unplanned event must be reported.
3. Enter the final time along with the time zone.
4. Optionally, you can enter a reason code and description.
5. Optionally, you can also add an attachment.
6. Optionally, you can add an estimate for events planned in the future.

Unable to Report Remaining Events

You can choose this option if you will never be able to provide the final time of the event.

Events History

Header

When you choose the **View Events History** button in the detailed view page, you can view all events reported during the freight execution in a card format. This includes all the planned and unplanned events that have been reported multiple times. For each event, you can view the following information in a card format:

- Event type
- Current status

  When a final time is reported for the planned event, you can view this information.
- Estimated status

  When an estimated time is reported for the planned event, you can view this information.
- Location
- Planned on
- Final time

  When a final time is reported for the planned event, you can view this information.
- Estimated time

  When an estimated time is reported for the planned event, you can view this information.
- Business partner
- Attachment
- Reason Code

  When a reason code is available for the planned event, you can view this information.
- Reason Code Description

  When a reason code description is available for the planned event, you can view this information.

Events Overview

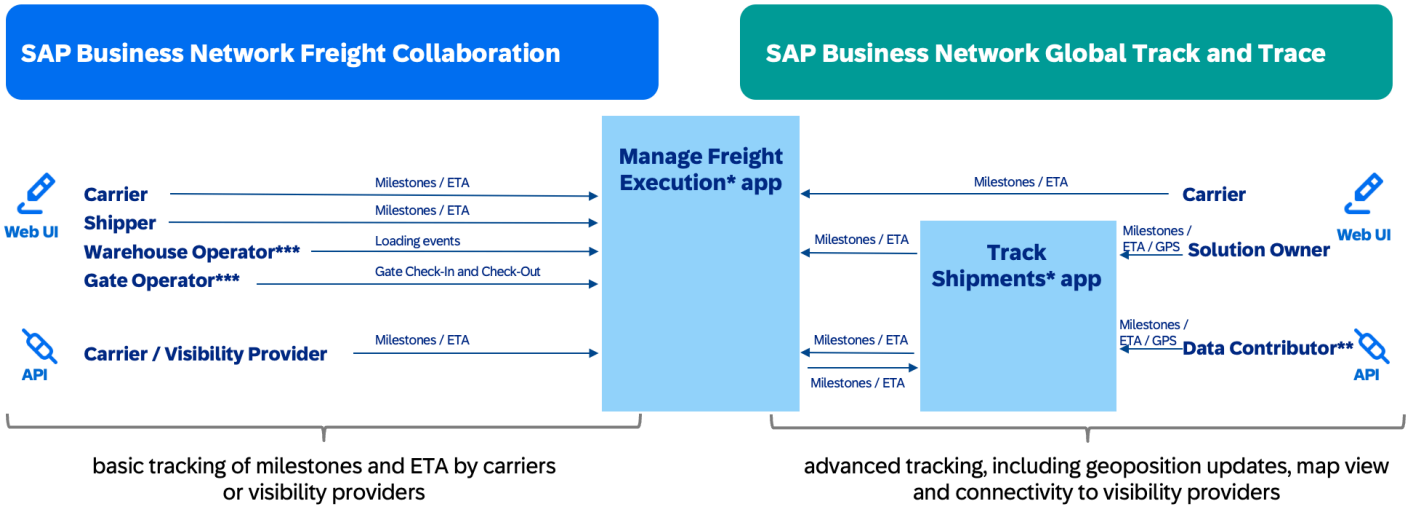

When you navigate to additional options in the Events Overview sub-tab and choose the View History button in the planned event card, you can view all the events that have already been reported for that specific planned event on the right pane.

Tracking Harmonization

Tracking harmonization provides a harmonized tracking experience in SAP Business Network for Logistics by clearly distinguishing the capabilities provided in SAP Business Network Freight Collaboration and SAP Business Network Global Track and Trace. As of now, capabilities are distributed amongst SAP Business Network Freight Collaboration (that primarily focuses on order management and dock appointment scheduling), and SAP Business Network Global Track and Trace.

In terms of tracking, SAP Business Network Freight Collaboration now supports basic tracking of milestone events and ETA. On top of these capabilities, SAP Business Network Global Track and Trace supports advanced tracking that also includes:

- geo position updates
- map view

Here is the comparison of the tracking capabilities before and after tracking harmonization in SAP Business Network Freight Collaboration:

Capability	Mode of Transport	Business Partner	Before Tracking Harmonization	After Tracking Harmonization
Milestone and ETA reporting via Web UI	Road	Carrier	✓	✓
Milestone and ETA reporting via Web UI	Ocean	Carrier	×	✓
Milestone and ETA reporting via Web UI	Road, Ocean	Shipper	×	✓
Map view (in 'Track Freight Movement' application)	Road, Ocean	Shipper	✓	×
Milestone and ETA reporting via API	Road, Ocean	Carrier	✓	✓
Milestone and ETA reporting via API	Road, Ocean	Visibility Provider	✓	✓

Capability	Mode of Transport	Business Partner	Before Tracking Harmonization	After Tracking Harmonization
Geoposition reporting via API	Road, Ocean	Carrier	✓	×
Geoposition reporting via API	Road, Ocean	Visibility Provider	✓	×
Loading and Uploading reporting via Web UI	Road	Warehouse Owner	✓	✓
Check-In and Check-Out reporting via Web UI	Road	Gate Operator	✓	✓

As part of the effort, the **Manage Freight Execution** app is provided for shippers and carriers. It has a central table for tracking information and a common look and feel. As a result, the following apps will be deprecated in 2026:

- **Track Freight Movement**
- **Freight Orders for Reporting**

Benefits

It has the following benefits to different users:

- **Shippers** gain insights into shipment execution and can now report logistics execution events via the new **Manage Freight Execution** app.
- **Carriers** can report **all** supported planned and unplanned events and view events reported by other business partners in the new **Manage Freight Execution** app. Previously, they could only report a small subset of events.

Impact

- If you have subscribed to SAP Business Network Freight Collaboration, you only need to switch to the new app before May 2026, as the **Freight Orders for Reporting** and **Track Freight Movement** apps will be deprecated then.
- If you have subscribed to SAP Business Network Freight Collaboration and want to use advanced tracking, you must do the following:
    1. Subscribe to SAP Business Network Global Track and Trace and onboard. For more, see Solution Owner Onboarding.
    2. Set up carrier manual reporting via Web UI. For more on how to set up, see Enable Manual Reporting For Carriers.

Restrictions

The restrictions include the following:

- Only the following shipments, events and fields in global track and trace are supported to be forwarded to the **Manage Freight Execution** app
    - **Shipments**: They must meet the following requirements:
        - They do not have tracking units assigned. For example, shipment with multiple containers is not supported.
        - They must have planned stops, and each stop must have at least one planned event.
    - **Events**: All milestone events are supported except for “location update”, “carbon emission” and “overdue” events. For a complete list of milestone events, see Event Code Descriptions.

Planned events without event match key can't be displayed in the **Manage Freight Execution** app.

- **Fields**: Only fields that are mapped for visibility provider integration in the global track and trace can be forwarded to the **Manage Freight Execution** app. For more, see Visibility Provider Integration .

- Events with private attachment URL provided can't be forwarded from SAP Business Network Global Track and Trace to SAP Business Network Freight Collaboration.

Applying Instance-Based Authorization

You can use Authorization Management of SAP Cloud Identity Service to apply instance-based authorization for the **Manage Freight Execution** app. You need to create custom authorization policies in which a collection of rules are defined. After you assign them to users, they can view documents that match the rules maintained in the policy.

Prerequisites

- You must migrate from SAP Authorization and Trust Management (XSUAA) to SAP Identity Authentication Service (IAS) at tenant level. For more information, see Migration of Authentication from XSUAA to IAS.
- You must enable policy-based authorizations in SAP Cloud Identity Service. For more information, see Configure Authorizations Based on Policies.

Authorization Policies

The **Manage Freight Execution** app supports the following custom authorization policies:

Policy	Description
restrictWithOrderingParty	This policy allows you to segregate documents based on ordering parties that are identified by shipper external ID. This ID is maintained in your backend SAP S/4HANA system. You can use the value help to select ordering parties. The value help only displays those ordering parties that you have maintained in the **Manage Locations** app with the object type as **Business Partner**. You can also enter free texts.
restrictWithTransportationMode	This policy allows you to segregate documents based on transportation modes. You can use the value help to select transportation mode codes. These are the transportation mode codes that are available in the **Assign Codes** app. You can also enter free texts.
restrictWithTransportMeans	This policy allows you to segregate documents based on transport means. You can use the value help to select transport means codes. These are the transportation means codes that are available in the **Assign Codes** app. You can also enter free texts.

ℹ Note

- These policies can be combined using "**And**" logic to further restrict access.
- You can only use the following operators when adding restriction conditions within these policies:
  - =
  - IN.

To configure the authorization policies for the **Manage Freight Execution** app, search for the IAS application with name "lbn-cis (<your subdomain name>)". The above-mentioned policies will be available in this IAS application in the **Authorization Policies** tab.

For more information on creating authorization policies, see Configuring Authorization Policies.

For more information on assigning authorization policies to users, see Assign Authorization Policies.

Results

Shippers assigned the **restrictWithOrderingParty** policy can only view freight documents associated with ordering parties specified within that policy.

Shippers assigned the **restrictWithTransportationMode** policy can only view freight documents whose transportation modes match the settings in this policy.

Shippers who have the **restrictWithTransportMeans** policy assigned can only view documents whose means of transport match the settings in this policy.

Shippers assigned multiple policies can only view freight documents that match the settings in all assigned policies.

Manage Disputes

As an ordering party, you can view the disputes that have been created for invoices that the carrier has submitted based on your freight documents, or you can view the disputes which the carrier has raised on self-billed freight documents.

When the system receives an invoice from the carrier, it checks the invoice against the freight document. If it detects inconsistencies, the system raises a dispute and informs you accordingly. You can then either accept the invoice as it is, or you can engage in dialog with the carrier with the aim of reaching a mutual agreement.

You can also have a self-billing process in place with the carrier, wherein the carrier does not submit an invoice for the transportation services. Instead, you settle automatically based on the information in your freight document.

In this process, you can have differences and potential disputes between what you expect to pay against what the carrier expects to be paid. To keep good business relationships, you need to work closely with the carrier to resolve these differences in a collaborative way. You need to get clarification on the differences and converge on an agreement with the carrier on how to resolve the differences.

A dispute can be raised based on either the carrier invoice or the self-billing freight document. Once the dispute has been resolved, the freight document charges are updated and it is sent back to your SAP Transportation Management system. An application-to-application (A2A) message is also sent from your LBN tenant to your SAP Transportation Management system. So when the invoice then reaches your SAP Transportation Management system, the system does not detect any discrepancies as the charges have been updated and it has been informed accordingly, so ideally no further dispute is created.

The freight collaboration option for SAP Business Network for Logistics enables your carriers to create disputes against your freight documents for additional unplanned freight costs. The carrier can create dispute against the freight document and submit the dispute for your review. Once the carrier submits the dispute, you can collaborate on the dispute with the carrier either from the **Manage Disputes** app in SAP Business Network for Logistics or from your external transportation system. You can select one of these options from the **General Settings** app.

You can enable a multi-step dispute approval process within your organization before submitting the dispute to the carrier. A dispute document can either be approved in a single step by a basic user at the first level or sent to supervisors or managers at the next levels for review based on the settings that you specify. Based on the range of the disputed amount, you can define multiple approver groups for various dispute amount ranges to approve the dispute. You can specify the approval conditions in the **General Settings** app. For more information, see Internal Approval Process.

ℹ Note

To use this app, you must add one or several roles to your role collection. The required role templates and application identifiers are described in the Available Roles for Shippers section of the Administration Guide for Shippers.

The **Manage Disputes** app consists of a main view and a detail view.

When you launch the app, the system displays the main view with the following areas:

- Filter bar

  Using the filter bar in the header, you can filter the disputes based on one of the following attributes, to restrict the number of disputes displayed:

  - **Dispute**
  - **Ordering party**
  - **Created On**
  - **Freight Document**
  - **Arrival Location**
  - **Arrival Location ID**
  - **Carrier**
  - **Changed By**
  - **Changed On**
  - **Consistency Status**
  - **Created By**
  - **Customer Account**
  - **Departure Location**
  - **Departure Location ID**
  - **Gross Amount**
  - **Gross Amount Currency**
  - **Invoice**
  - **Open Disputes**
  - **Parent Document Type**
  - **Parent Gross Amount**
  - **Partner Gross Amount**
  - **Purchasing Group**
  - **Resolved Disputes**

- Worklists

  You can use the following worklists: **All**, **For Review**, **For Approval**, **Rejected**, **Reviewed**, and **Resolved**.

From the main view, you can navigate to the detailed view of a dispute. The detailed view has the following areas:

- Header

  You can view the following information:

  - **General Details**

Displays the freight document ID, contact details, change history, and purchasing group. When you choose the freight document ID, contact details, and change history, you can view the additional details in a card format.

- **Freight Document Amount**
- **Ordering Party's Proposal with Tax**

  Displays the final amount that you proposed along with the taxes.
- **Carrier's Proposal**
- **Dispute Status**

  For more information on the dispute statuses, see Reviewing Disputes from Carrier.

- Sections

  You can view further details of the freight document in the following sections:

  - **Charges**
  - **Notes**
  - **Attachments**

Worklist (Manage Disputes)

To restrict the number of disputes displayed, you can use the preconfigured worklists (**For Review**, **Reviewed**, **Resolved**, and **All**) that are based on the dispute status.

All

The **All** worklist displays all the disputes from carriers that are in the system. The system displays the following information for each dispute:

- **Dispute**

  Displays the dispute ID, billing type (self-billing or carrier invoice), and number of open disputes and resolved disputes. Note that when there are one or more open disputes and you choose the number of open disputes, you can quickly view the details of disputed charges.
- **Freight Document**
- **Ordering Party**

  Displays the name of the ordering party.
- **Carrier**

  Displays the carrier details
- **Departure Location**

  Note that in case of a dispute based on a collective carrier invoice, you can view these details only if the departure location is the same in all the freight documents for settlement.
- **Arrival Location**

  Note that in case of a dispute based on a collective carrier invoice, you can view these details only if the arrival location is the same in all the freight documents for settlement.
- **Freight Document Amount**

Displays the original freight document amount from you

- **Carrier's Proposal**

  Displays the gross amount for the freight document along with the disputes proposed by the carrier.

- **Ordering Party's Proposal**

  Displays the gross amount for the freight document along with the disputes proposed by you.

- **Open Disputes**

  Displays the total number of open disputes.

- **Resolved Disputes**

  Displays the total number of resolved disputes.

- **Changed On**

- **Comments**

  You can either add new comments or view or edit the existing comments in a dialog box that appears. The comments that you enter here are visible to the users internally within your organization.

- **Customer Account**

- **Document Status**

  Displays whether the dispute is for approval, reviewed, submitted for confirmation, resolved, or rejected.

- **Freight Document**

  Displays the freight document ID. When you choose the freight document ID, you can navigate directly to the freight document in your SAP Transportation Management system.

  Note that to enable this navigation, you must maintain a correct document link in the **System Connections** app. For more information, see Configuring Links to Business Documents in External Systems.

- **Invoice**

- **Purchasing Group**

  Displays the purchasing group ID from your transportation system

For Review

The **For Review** worklist displays disputes from carriers that need your action. This worklist displays the same information as the **All** worklist.

You can select one or more dispute documents from the **For Review** worklist and choose **Confirm and Submit** or **Reject and Submit**. Note that you can only select a maximum of 10 dispute documents at a time.

For Approval

The **For Approval** worklist displays disputes that are submitted internally in your organization for approval by approver groups. Only documents that you can approve are present in this tab. This worklist displays the same information as the **All** worklist.

Rejected

If the approver rejects a dispute document, the system updates the dispute status as **Rejected** and moves the dispute to this worklist. This worklist displays the same information as the **All** worklist.

Reviewed

The **Reviewed** worklist displays disputes from carriers that are reviewed and submitted by you. This worklist displays the same information as the **All** worklist.

Resolved

The **Resolved** worklist displays disputes that have been resolved, that is, both the parties have converged on an agreement and resolved the differences. This worklist displays the same information as the **All** worklist.

Detail View (Manage Disputes)

The detail view of a dispute consists of a header and several sections.

Header

You can view the following important information about the dispute:

- **General Details**

  Displays the following information:

  - Freight document

    Displays the freight document ID. When you choose the freight document ID, you can navigate directly to the freight document in your SAP Transportation Management system.

    Note that to enable this navigation, you must maintain a correct document link in the **System Connections** app. For more information, see Configuring Links to Business Documents in External Systems.

  - Contact details

    When you choose the contact details, you can view the phone number, email ID, and address of the ordering party in a card view.

  - Change history

    When you choose the **Details**, you can view the administrative data in a card view.

  - Purchasing group

    Displays the purchasing group ID from your transportation system.

- Amounts

  Displays the following information:

  - Freight document amount

    Displays the original freight document amount.

  - Amount invoiced until now

    Displays the sum of invoiced charge lines.

- Carrier's proposal

  Displays the gross amount for the freight document along with the disputes proposed by the carrier.

- Ordering party's proposal with tax

Displays the gross amount for the freight document along with the disputes proposed by you.

- Dispute status

  Displays the status of the dispute, that is whether it is New, Submitted, To be approved or Resolved.

- Comments

  You can either add new comments or view or edit the existing comments in a dialog box that appears. The comments that you enter here are visible to the users internally within your organization.

Information

The information section displays the following details:

- General

  Displays the following information:

  - Dispute ID
  - Freight Document ID
  - Purchasing Group

- Administrative Data

  Displays the date and time the dispute was created and the details of the person who last modified the dispute and the time.

Reference Documents Section

Displays the document type and document ID of the reference documents added by you and your ordering party during the settlement process. Additionally, you can add a reference documents by choosing the add icon. Enter the document type and document ID of the reference document.

You can also download the reference document details in a spreadsheet. You can view the following details in this document:

- Document ID
- Document Type Code
- Document Type Description
- Created On (UTC)
- Created By

Charges

The following are the subtabs in the Charges section:

- Freight Document

  You can view all the charges from the freight document in this tab. Based on the type of the charge, you can view one of the following additional information for each charge description:

  - To be invoiced

    Displayed when the charge line is yet to be invoiced.

  - Subsequent
