When the ordering party rejects a dispute document, you can re-submit the dispute document by adding a note for the rejected charge line without modifying the rate amount. Note that this is relevant only for disputes from SAP Business Network Freight Collaboration.

The ordering party has rejected the dispute document with the reason as attachment missing. In this scenario, you can add an attachment without modifying the rate amount and submit the dispute document.

Invoice Process Settings

You can select the invoice process settings. On dispute resolution, when you submit the dispute to the ordering party, a dialog box appears and you can choose one of the following options for the invoice:

- Submit the invoice with updated charges to the ordering party

  If you select this option, once the dispute is resolved between you and the ordering party, the invoice with the updated charges related to this dispute will be submitted to the ordering party. If there are taxes in the invoice, you can modify the taxes before resolving the dispute so that the invoice is submitted to the ordering party with the appropriate tax amounts.

- Update the invoice and set the status as Ready for Submission

  If you select this option, once the dispute is resolved between you and the ordering party, the invoice related to this dispute will be updated and the status will be set as **Ready for Submission**. You can navigate to the invoice in the **Manage Invoices** app and submit it.

- Set the invoice status as Rejected by Dispute

  If you select this option, once the dispute is resolved between you and the ordering party, the invoice related to this dispute will be set as **Rejected by Dispute**. You can create and submit a new invoice.

ℹ Note

This setting is applicable only when there is a change in the invoice post dispute process.

An information message indicating the status of the invoice after dispute resolution appears on the header area of the dispute details page. If you want to modify the invoice process settings, you can do so using the link available in the information message.

Acknowledgement Message After Dispute Resolution

A dispute is resolved when the shipper or the carrier accepts all charges proposed by the other party. For example, the carrier proposes charges and the shipper accepts these charges. When the party that has the document accepts all the charges, then the system updates these charges in the freight document in the shipper's SAP Transportation Management (SAP TM) system and the dispute status is updated as **Submitted for confirmation**.

When the resolved charges that have been agreed upon by the shipper and the carrier in the freight collaboration option for SAP Business Network for Logistics are updated in the shipper's SAP TM system, the system displays an acknowledgment message that the charges have been updated. If the charges are not updated, the system displays a failure message.

- Success message

  When a successful acknowledgment message is received in the freight collaboration option, the status of the shipper's dispute is set to **Resolved**. Then, the carrier dispute is set to **Resolved**, after which the carrier invoice status is updated to **Submitted** (for an invoicing dispute) and the carrier invoice is submitted to the SAP TM system.

When the system receives an acknowledgment message from the SAP TM system, it sets the dispute status changed as **Resolved**.

- Failure message

  If the SAP TM freight document update fails, `TransportationOrderChargeElementRequest_In` will fail with errors, and the acknowledgment message (`TransportationOrderChargeElementConfirmation_Out`) will not be triggered. The shipper must process this error in Forward Error Handling (FEH), which has already been registered and implemented on the inbound side for `TransportationOrderChargeElementRequest_In`. FEH is configured to perform error handling. Therefore, the error message is forwarded to FEH post-processing, which the shipper can access by choosing the red flag. You user launches the transaction `sxi_monitor` in the shipper's system and provides the interface name as `TransportationOrderChargeElementRequest_In`.

- Error message

  If `TransportationOrderChargeElementConfirmation_Out` message contains any error, it will set the dispute status as **In Error**. The error must be addressed in the SAP TM system and the dispute can be re-triggered. This will resend the `TransportationOrderChargeElementRequest_In` message to update the charges again.

Dispute Inconsistencies During Freight Document Updates

Updates in self-billed freight documents are reflected in the dispute document in the carrier's system and are marked as inconsistent.

When a carrier, creates a dispute on a self-billed freight document and the ordering party also makes changes to the self-billed freight document in their SAP Transportation Management system, the system notifies the carrier that the carrier is disputing on a document that has recently been changed. The system displays the following message to the carrier: **Some of the charges have inconsistent values due to changes in the freight document**. Also, the system highlights the relevant lines and indicates as **Inconsistent (Updated)** or **Inconsistent (Deleted)**. The carrier can accept the new charges or create a new dispute with the new frame of reference.

ℹ Note

The system does this only for disputes on self-billed freight documents. Also, the system does this only for disputes that are managed by the ordering party in their SAP Business Network for Logistics system and not in their external transportation system.

When the carrier chooses **Merge charges**, the line that was previously marked as being **Inconsistent (Updated)** or **Inconsistent (Deleted)** is no longer in dispute and the system no longer highlights the line.

If other lines are in dispute, the system continues this process.

However, if there are no other disputed lines and if the carrier submits the document, the dispute status changes to **Submitted for confirmation**.

If the document is with the ordering party, the disputed line is highlighted and marked as **Inconsistent (Updated)** or **Inconsistent (Deleted)**. The document is editable in the ordering party's system but not in the carrier's system. If there are disputed lines that are inconsistent, the system displays the following message to the ordering party: **Some of the charges have inconsistent values due to changes in the freight document**. When the ordering party accepts the charges, the line that was previously marked as being **Inconsistent (Updated)** or **Inconsistent (Deleted)** is no longer in dispute, and the system no longer highlights the line.

If other lines are in dispute, the system continues this process.

However, if there are no other disputed lines and if the document is submitted by the ordering party, the dispute status changes to **To be reviewed** and is sent to the carrier for approval. The carrier can view the updated charges.

APIs for Planning in External System

As a carrier, you can use the APIs in SAP Business Network Freight Collaboration for planning in external system.

The ordering party creates transportation requirements from a sales order, purchase order, or delivery documents in their SAP Transportation Management system and sends it to you and requests you to perform planning activities in your system. Once you create a planned freight document in your system, you can send the document containing the transportation requirements back to the ordering party.

You can perform these activities using the following APIs:

- **Consumer API to Request for Planning in External System**
- **Provider API to Create Planned Freight Document from External System**
