    - Number of Loading Stops
    - Number of Unloading Stops

- Locations

  Displays the following information:

    - Departure Location
    - Departure Date and Time
    - Arrival Location
    - Arrival Date and Time
    - Airport of Departure
    - Airport of Destination

- Terms and Conditions

  Displays the following information:

    - Incoterm
    - Incoterm Location

      Displays the incoterm location details. Note that you can view the incoterm location details that the ordering party has added in the Manage Locations app. If the ordering party has not added this information, you can view the text specified for incoterm location in the ordering party's external transportation system.

    - Contract Condition Code

      Displays the contract condition code that the shipper has maintained in their SAP Business Network for Logistics system. Displays one of the following values:

        - Door to Door
        - Door to Port
        - Port to Door
        - Port to Port

- Administrative Data

  Displays the date and time you received the freight booking and the details of the person who last modified the booking and the modified time.

- Reference Documents Section

  Displays the document type and document ID of the reference documents. You can add a reference document by choosing the add icon. Enter the document type and document ID of the reference document.

  You can also download the reference document details in a spreadsheet. You can view the following details in this document:

    - Document ID
    - Document Type Code
    - Document Type Description

Cargo

The Cargo section displays the following data about the cargo items involved:

- Item ID

  Displays the cargo item ID.

- Cargo Type

  Displays whether the cargo item is a package, product, or a container.

- Container Type

  Displays the container type code.

- Cargo Details
- Quantity
- Gross Weight
- Gross Volume
- Nature of Goods

  Displays the nature of goods description specified by the ordering party.

- Special Requirements

  Displays one or more icons for the following special requirements:

  - Dangerous Goods
  - Temperature Control
  - Stackable
  - Over Dimensional

  When you choose the special requirement icon for dangerous goods, you can perform the following:

  - View the dangerous goods information in a dialog box
  - Select the language in which you want to view the dangerous goods details
  - View the dangerous goods details for all the cargo items in this dialog box. When you navigate from a specific cargo item, you can view the dangerous goods of that cargo item.
  - Search the dangerous goods details for a specific cargo item using the search bar

When you select the details icon from a cargo item, the system displays the cargo information in a new page. The system displays the following information:

- Header
  - Booking Details

    On the header area, you can view the following booking information:

    - Ordering Party
    - Departure Location

        - Arrival Location
    - Cargo Overview

      On the header area, you can view the following cargo details:

        - Cargo Type
        - Cargo Details
    - Special Requirements

      On the header area, you can view the following special requirements:

        - Dangerous Goods (Yes/No)
        - Temperature Control Required (Yes/No)
        - Stackable (Yes/No)
        - Over Dimensional (Yes/No)
- General Information

  This tab displays the following details:

    - Logistic Details
        - Quantity
        - Length * Height * Width
        - Shipper Load Count
        - Gross Weight
        - Net Weight
        - Tare Weight
    - Other Details
        - Insurance Value
        - Goods Value
        - Goods value for customs
    - Nature of Goods

      Displays the nature of goods description specified by the ordering party.
    - Commodity Code

      Displays the commodity code type and the code.
- Stages

  This tab displays the following information:

    - Stage
    - Means of Transport
    - Mode of Transport

Note that in the Assign Codes app, if you do not maintain the mapping between Code in External System and LBN Code for the values in the below table, then the system does a default mapping to the respective value.

Mode of Transport

SAP Transportation Management System	SAP Business Network for Logistics System
03 - Ocean	01 - Ocean
01 - Road	03 - Road
05 - Air	04 - Air

    - Departure Location
    - Departure IATA
    - Arrival Location
    - Arrival IATA
- Activity
    - Cargo Type
    - Activity
    - Location
    - Planned Start Date of Activity
    - Planned End Date of Activity
    - Planned Departure Date and Time
    - Planned Arrival Date and Time

ℹ Note

- The ordering party can implement a business add-in (BAdI) to display only the main cargo items.
- Any notes sent by the ordering party with text type `LBNMI` will be discarded as it is a technical text type used to display main cargo items.

  You can view the aggregated dangerous goods information for the filtered items at the main cargo item level.

Locations

For each stop, the system displays the following information:

- Stop Number
- Location
- Planned Arrival Date and Time
- Planned Departure Date and Time
- Activities Overview

- Distance to Next Stop
- Time to Next Stop

Date and Time

Displays the date and time details for each stop. Depending on the type of stop, the system displays the date and time information. The following are the different types of stops:

- Pick-Up Location

  Indicates the source location of the first pre-carriage stage.

- Delivery Location

  Indicates the destination location of the last on-carriage stage.

- Airport of Departure

  Indicates the source location of the first main carriage stage.

- Airport of Destination

  Indicates the destination location of the last main carriage stage.

The system displays these dates and times in the time zone of their respective stop location. Note that the system receives this time zone information for a location from the transportation management system. If there is no time zone associated with a location in the transportation management system, then the system receives this time zone information from the location master in the SAP Business Network for Logistics system. If there is no time zone associated with a location in the location master, then the system by default displays the time zone as UTC for that location.

Stages

Displays the following information:

- Stage Type

  Displays whether the stage is a pre-carriage, on-carriage, or main carriage stage.

- Transport

  Specifies the mode of transport and means of transport details. The mode of transport specifies one of the following values:

  - Maritime transport
  - Road transport
  - Air transport

  The mode of transport specifies one of the following values:

  - Sea
  - Road
  - Air

- Departure Location

If the ordering party has sent the departure location details, you can view the IATA airport code and the location of departure with the address and contact details. If not, you can enter the IATA airport code and update the freight booking.

- **Arrival Location**

  If the ordering party has sent the arrival location details, you can view the IATA airport code and the location of arrival with the address and contact details. If not, you can enter the IATA airport code and update the freight booking.

- **Date and Time**

  Displays the planned arrival and planned departure date and time.

- **Journey**

  Displays the flight code. Note that the flight code is the combination of the airline code (for example, LH for Lufthansa), followed by the flight number.

  Note that the journey details are editable only in main carriage stages.

When you select the details icon from a stage, the system displays the stage details in a new page. You can view the following information:

- **Transport Details**

  Displays the means of transport and mode of transport details.

- **Location Details**

  Displays the departure and arrival location details.

- **Journey Details**

  Displays the flight code.

- **Expected Date and Time**

  Displays the expected arrival and departure date and time.

- **Cargo Items Table**

  Displays the following details of the associated cargo items in a table format:

  - **Item ID**
  - **Cargo Type**
  - **Cargo Details**
  - **Quantity**
  - **Gross Weight**
  - **Gross Volume**
  - **Special Requirements**

Contacts

The **Contacts** section displays the following information for a contact in a card format:

- **Contact Type**
- **Name**

- Address
- Phone Number
- Email

You can view different icons in these tiles for the following:

- Various business partners such as shipper party, consignee party, forwarding agent, customs agent, and notify party
- Important locations such as, departure location, airport of departure, airport of arrival, and arrival location.

Attachments

In the Attachments tab, you can upload attachments that you want to send to the ordering party and view the attachments sent by the ordering party to you.

You can also toggle the view between the attachments that you have uploaded, the attachments from the ordering party, and the all the attachments.

ℹ Note

- Attachment file type must be base 64
- You can attach documents related to the business document or business process in this section. You're recommended to avoid attaching sensitive personal data.
- You can only upload files that fulfil the following criteria:
    - Files must be of one of the formats: jpeg, gif, png, .pdf, .doc, .docx, .xls, .xlsx
    - Image files must be less than 6MB file size
    - Document files must be less than 5MB file size
    - When you mention the file path, you must mention the file name along with the extension.

Notes

The Notes section displays the notes the ordering party has sent you. You can as well enter your own notes.

ℹ Note

- Notes are intended to provide additional information related to the business document or business process. You're recommended to avoid entering sensitive personal data.
- Any notes sent by the ordering party with text type `LBNMI` will be discarded as it is a technical text type used to display main cargo items.
- You can enter notes when you reject a freight order. The ordering party can view these rejection notes in their transportation system.

Managing an Air Freight Booking

You can perform the following actions on a freight booking:

Confirming a Freight Booking

You can confirm a freight booking with the status as **New**. You can confirm a freight booking either from the worklist page or the freight booking details page. You can select one or more freight bookings from the **New** worklist and choose **Confirm**. You can also enter information in the editable fields in the freight booking details page and then confirm a freight booking. Note that once you confirm a freight booking, the status of the freight booking changes to **Confirmed**.

Updating a Freight Booking

You can update a freight booking with the status as **Confirmed**. In the details page of a confirmed freight booking, you can update the information and choose **Update**.

In the **Stages** tab, you can now specify an IATA code for a location for which there is no location details or IATA code specified.

Rejecting a Freight Booking

You can reject a freight booking with the status as **New** or **Confirmed**. You can reject a new freight booking from the worklist page or the freight booking details page. You can select one or more freight bookings from the **New** worklist and choose **Reject**. You can also reject a confirmed booking from the freight booking details page.

Manage Locations

ℹ Note

To use this app, you must add one or several roles to your role collection. The required role templates and application identifiers are described in the Available Roles for Shippers section of the Administration Guide for Shippers.

You can use the Manage Locations app to manage location master data either manually replicated from another system or created from scratch using the app. Location master data can then be consumed by other apps, such as Docking Location Settings, in SAP Business Network Freight Collaboration.

You can set up a location replication using the Data Replication Framework (DRF) in the SAP S4/HANA source system. For more information, see the *Business Configuration* section of the *Administration Guide for Shippers*.

Location master data consists of not only the address information, but also the business purpose of a location. Additionally, the master data of a location can include one or more alternative IDs so that the location becomes cross-platform identifiable.

The main features of this app include:

- View a location
- Create a location
- Upload locations
- Edit a location

ℹ Note

- The Manage Locations app implements all security features and data protection-relevant functions documented in the "Security and Data Protection and Privacy" section of the *Administration Guide*.

- A location master data record enters the blocking period if it has not been accessed for three consecutive years. The blocking period lasts for another three years, during which only audit specialists can access the record. The record will then be automatically deleted when the end of the blocking period is reached.

Creating a Location

To create a location, proceed as follows:

1. Click **Create** on the upper-right corner of the **Locations** table. The **Create New Location** page opens.
2. On the **Create New Location** page, enter the following details:
    - **Source**: Source of the location. Valid values are:
        - **SAP SCM Logistic Location**: Locations from one of the following systems:
            - SAP Extended Warehouse Management
            - SAP Transportation Management
        - **SAP ERP Location**: Locations from an SAP ERP system
        - **Others**: Locations from other systems
    - **Location Type**: Type of the location

      This field is available when **Source** is set to **SAP SCM Logistic Location**.
    - **Object Type**: Business purpose of a location.

      This field is configurable when **Source** is set to **SAP ERP Location** or **Others**. When **Source** is set to **SAP SCM Logistic Location**, the system automatically sets **Object Type** to **Logistic Location**.

      Valid values for the Object Type field are::
        - **Business Partner**
        - **Customer**
        - **Plant**
        - **Shipping Point**
        - **Supplier**

      If none of the values above fits the location's business purpose, you can change **Source** to **SAP SCM Logistic Location** as an alternative. This will set **Object Type** to **Logistic Location** at the backend and make **Location Type** configurable. The **Location Type** field provides you with a broader list of types pertaining to various business purposes, such as port and hub.

      > **Note**
      >
      > You can also maintain the information of an ordering party in this app by setting the **Object Type** field to **Business Partner**.

    - **Description**: Descriptive information about the location
    - **Source System/External ID**: Source system from which the location master data is copied and the corresponding ID.

- If you are creating a location from scratch, set the **Source System** part to LBN, and set the **External ID** part to the location ID you previously prepared.
- If you are importing a location from SAP Transportation Management (TM), set the **Source System** to the business system name of your TM system and set the **External ID** to the location ID in TM.

  For locations that have its object type set to "Business Partner", you can find the business system name of your TM system and the location ID in the SOAP request message sent to LBN. In this request, the *MessageHeader.SenderBusinessSystemID* attribute specifies the business system name and the internal ID of the sender (the *MessageHeader.SenderParty.InternalID* attribute) specifies the location ID.

  Alternatively, you can run transaction code *SLDCHECK* in TM to view the business system name.
- **Logical System**: You can also use the **Logical System** field to identify the system from which the location master data is replicated.

  The **Logical System** field is is optional in SAP Business Network Freight Collaboration. If you've only purchased the freight collaboration solution, leave this field empty. If you've purchased both freight collaboration and global track and trace, refer to the configuration for global track and trace to maintain the logical system ID.

- (Optional) **Address**:
  - **Country/Region**
  - **State**
  - **City**
  - **District**
  - **Street/House Number**
  - **Zip Code**
- (Optional) **Geographical Coordinates And Map**:
  - **Longitude**: Longitude coordinate of the location
  - **Latitude**: Latitude coordinate of the location

  ### ℹ Note

  You can enter the coordinates in the **Longitude** and **Latitude** fields manually. If you want the system to verify your entries, set **Calibrate coordinates when saving** to **Yes** before you save your changes. You can also choose **Generate Longitude and Latitude Coordinates** to create the coordinates according to the address information you've entered.

  By default, **Calibrate coordinates when saving** is set to **Apply global settings**, meaning that how the system handles coordinates for the location record you are working on is determined by the option you choose in the **Generate geo-coordinates automatically** setting, which can be found in the **Settings** dialogue box. If you leave **Generate geo-coordinates automatically** with the default option, the system generates geo-coordinates for locations when both the latitude and longitude coordinates are missing. For more information, see Global settings for Geo-Coordinates.

- (Optional) **Time Zone**
- (Optional) **Alternative Location ID**:
  - **Type**: Type of the alternative ID.
  - **ID**: Alternative ID in the specified type.
