SAP Business Network Global Track and Trace

The aim of SAP Business Network Global Track and Trace is to capture, process and store tracking information about tracked business processes. Then, it allows business users to get real-time transparency of the execution of those processes. They can query any tracked process and display its retrieved data from end to end.

SAP Business Network Global Track and Trace is a cloud service solution based on SAP Business Technology Platform. It's integrated with the following SAP S/4HANA systems:

- SAP S/4HANA (on-premise)
- SAP S/4HANA Cloud Private Edition

Both two systems have the Transportation Management (TM) component embedded, which can work with SAP Business Network Global Track and Trace.

ℹ Note

The following documentation uses the term *SAP S/4HANA* to refer to both SAP S/4HANA Cloud Private Edition and SAP S/4HANA (on-premise). If any of the information provided applies to only SAP S/4HANA Cloud Private Edition or SAP S/4HANA, this will be clearly specified.

To learn more about the SAP Business Network add-ons for project44 visibility services, see the Feature Scope Description for project44 Add-Ons and the Configuration and Application Guide for project44 Add-Ons.

ℹ Note

The apps provided with SAP Business Network Global Track and Trace run on desktops, as well as tablet devices that have a screen format wide enough to display the overview section and the detailed section of the screen, side-by-side.

Solution Owner Apps

This chapter provides application help on all the apps used by solution owners as part of SAP Business Network Global Track and Trace.

Overview

The following apps are available for Solution Owners:

Model Management

App	Description
Manage Models	to create and deploy a GTT metadata model that meets the business requirements for events and logic
Check Processes and Events	to display, dynamically and in a user-friendly way, a tracked process with its event data, based on a deployed GTT metadata model

Business Operations

App	Description
View Logs	to have an at-a-glance overview of the available logs and their statuses
Manage Message Logs	to view all the technical logs for all the message data, phase by phase and, if necessary, retrigger certain events or their correlations for the message
Manage Event Logs	to view all the technical logs for all the event data, phase by phase and, if necessary, retrigger one or multiple events or their correlations
Manage Integration Logs	to monitor the inbound and outbound integration messages related to location replication and visibility providers that are processed by SAP Business Network for Logistics

Fulfillment Tracking

App	Description
Track Shipments	to monitor the real-time execution status of LE-TRA shipments and freight documents from SAP S/4HANA and report events manually
Monitor Inbound ASNs	to monitor the fulfillment status of inbound ASNs/deliveries
Monitor Outbound Deliveries	to monitor the fulfillment status of outbound deliveries
Track SO Fulfillment	to monitor the fulfillment status of sales orders
Track PO Fulfillment	to monitor the fulfillment status of purchase orders

For more information on the Fulfilment Tracking apps, see Fulfillment Tracking Apps.

In addition, SAP Business Network Global Track and Trace incorporates apps that are, or will be, standard across SAP Business Network for Logistics, including:

Manage Network

App	Description
Invite Business Partners	to invite business partners already known to join their business network and check their participation status
System Connections	to create a connection and to authenticate inbound messages to SAP Business Network for Logistics from your on-premise SAP Transportation Management standalone system or Transportation Management embedded in SAP S/4HANA
Configure Partner Connections	to establish a B2B connection to the external systems of your business partners
Manage Business Profile	to view and edit your company profile such as contact details and business partner type
Manage Notification Templates	to create a template for a notification email of an event, such as that a sales order has been created, for use with the notification service
Manage Locations	to manage location master data either manually copied from another system or created from scratch

App	Description
Discover Business Partners	to search onSAP Business Network for Logistics and select suitable business partners, they may or may not already know, to invite to join their business network

Retention Management

App	Description
Blocking Store	to access restricted data during its blocking period
Retention Management	to define rules that determine the residence and blocking periods of personal data

Further, the Reminder service is introduced that allows you to create a template email for an event, such as that a sales order has been created, and automatically send to the involved parties of a tracked process, an email based on the template. It uses the Manage Notification Templates app to create the template and the Manage Models app to set up the notifications.

Fulfillment Tracking Apps

Fulfillment tracking apps monitor the fulfillment status of:

- sales orders, purchase orders, outbound and inbound deliveries, shipments in SAP S/4HANA
- freight units and freight orders in TM in SAP S/4HANA.

Fulfillment tracking apps are ready-to-consume standard apps based on the GTT standard model. The standard model allows extensibility to add user-defined tracked processes, field types, event types, code lists, planned event extensions, and event-to-action scripts.

If you want to send documents from SAP S/4HANA to SAP Business Network Global Track and Trace, refer to How to Send Documents from SAP S/4HANA to SAP Business Network Global Track and Trace and make sure that you meet the requirements for the product version mentioned in its Prerequisites section. The sample codes for the fulfillment tracking apps are available in the following GTT repository in the SAP Samples organization on GitHub.com: https://github.com/SAP-samples/logistics-business-network-gtt-standardapps-samples . You can find a document explaining how to download and install the sample codes in the repository.

> **Note**
>
> The sample codes are not provided as part of standard delivery, but only as an example to show you how to set up the SAP S/4HANA extractors for use with fulfillment tracking apps. They are not standard codes and you can customize them for your business scenarios.
>
> You should determine what documents with certain condition need to be sent to SAP Business Network Global Track and Trace for tracking. You don't need to send unnecessary ones. For example, if you only need the sales order, then you don't have to implement the purchase order.

On the contrary, If you want to send documents from SAP Business Network Global Track and Trace to other SAP systems, refer to How to Send Documents from SAP Business Network Global Track and Trace to Other Systems.

Based on your business needs, you can perform the following configuration tasks to enhance the functionality and the usability of fulfillment tracking apps:

- Adapting the UI

- Navigate to Fulfillment Tracking Apps from External Systems
- Define My Tracking Status.

Track Shipments App

A standard app :

- for transportation planners
- to monitor the real-time execution status of LE-TRA shipments from SAP S/4HANAand freight documents from TM in SAP S/4HANA and report events manually.

To know how to synchronize actual events back to TM in SAP S/4HANA in the Fulfillment Tracking apps, see Synchronize Actual Events Back to TM in SAP S/4HANA.

For more information on how to use this app, see *Guide for Transportation Planners*.

Monitor Inbound ASNs App

A standard app :

- for receiving specialists
- to monitor the inbound ASN/delivery fulfillment status.

To know how to integrate with Ariba Network, see How to Integrate SAP Business Network Global Track and Trace with Ariba Network.

To know how to synchronize ETA of the inbound delivery to yourSAP S/4HANA system, see Synchronize ETA of the Inbound Delivery Back to SAP S/4HANA.

For more information on how to use this app, see *Guide for Receiving Specialists*.

Monitor Outbound Deliveries

A standard app :

- for shipping specialists
- to monitor the fulfillment status of outbound deliveries

For more information on how to use this app, see *Guide for Shipping Specialists*.

Track SO Fulfillment App

A standard app :

- for internal sales representatives
- to track the fulfillment status of sales orders with integration to SAP S/4HANA, TM in SAP S/4HANA and visibility providers.

For more information on how to use this app, see *Guide for Internal Sales Representatives*.

Track PO Fulfillment App

A standard app :

- for purchasers
- to track the purchase order fulfillment status with integration to SAP S/4HANA, TM in SAP S/4HANA and visibility providers.

For more information on how to use this app, see *Guide for Purchasers*.

Track Shipments

For information on how to use this app, see Guide for Transportation Planners.

Monitor Inbound ASNs

For information on how to use this app, see Guide for Receiving Specialists.

Monitor Outbound Deliveries

For information on how to use this app, see Guide for Shipping Specialists.

Track SO Fulfillment

For information on how to use this app, see Introduction.

Track PO Fulfillment

For information on how to use this app, see Guide for Purchasers.

Adapting the UI

This section describes how to adapt the UI of the fulfillment tracking apps. When you are in the adaptation mode, you have many options to adapt the UI to your liking. You can also adapt and save certain views.

The content in this section is an excerpt from Adapting SAP Fiori UIs at Runtime - Key User Adaptation, and adapted for the use in SAP Business Network Global Track and Trace. It might not be updated timely. You can check out more details and timely updates on this function with the link provided.

Prerequisites

- You have added the roles of fulfillment tracking apps and and two flexible UI configuration roles “UIConfigureTemplate” and “FlexKeyUser”to the role collection in SAP BTP cockpit. For the role templates and application identifiers, see Available Roles for Solution Owners.
- You have started the **UI Adaptation** mode. To do that, click **Adapt UI** in the user actions menu.

Overview

Header Bar

Version History	If the user interface of the current app has been adapted previously, you can switch to a recent version or to the original app. Just click on the title of the current version to expand the version history, then select a version from the dropdown list to display it.
Activate New Version	Use to activate the current draft or a selected version that is not currently active, so it becomes a new version.
Discard Draft	This option is only available when you display a draft that has not yet been activated. Use to discard all UI changes that you did in draft mode. You can then start adapting the UI again, based on the last activated version.
Publish Version	This option is only available when you display an unpublished version. Use ***(Publish Version)*** to publish a version of a changed app to a target subaccount.
UI Adaptation and Navigation modes	When UI Adaptation is activated, you can edit the current screen on which you started the adaptation mode, but you cannot navigate using a button (for example, to another list item, screen, or dialog box triggered by the button). To interrupt the adaptation mode and reach these "hidden" elements, choose Navigation. Now you can navigate on the UI as usual, for example to reveal other areas. Please note: Any changes you make while you're in the Navigation mode (for example setting a filter) will not be saved later. So make sure you choose UI Adaptation again before you make further changes that you want to preserve.
Visualization mode	This highlights all or certain supported key user changes that have been made on the UI and are part of the current UI. When you click on a highlighted change, you see details about all changes made to this element, including a timestamp for when the changes were saved. When you're in this mode, you will also see a dropdown list in the header bar that lets you filter for certain change types. By default, you see **All Changes**.
More Actions	Use ***(More Actions)*** to display a menu containing additional actions. This menu contains actions for translating UI changes. These actions, as well as the icon are only visible if you have the AdminFlexKeyUser role.
Undo and Redo	Use to undo and to redo the changes you made during your current session.
Feedback	Use ***(Feedback)*** to share your feedback on key user adaptation with the development team at SAP.
Save Draft	Use ***(Save Draft)*** to save your UI changes. The changes are saved as drafts and are not visible to end users until you activate them.
Exit	When you're done with your UI changes, use ***(Exit)*** to exit the UI adaptation mode and return to your running app.

For the specific kinds of changes you can make on the UI, check the subpage of this chapter.

Security

UI adaptation should not be used as a means to fulfill security requirements. UI changes affect only the visibility of the respective elements on the UI. Example: If you remove a field, it doesn't show up on the UI any longer. However, no other security measures

are applied that prevent a user from accessing the data associated with the removed field. If you want to restrict access to certain data for security reasons, this has to be done in the back-end system via roles and authorizations.

Making UI Changes

When you're in the adaptation mode of a worklist page or detail page, you can edit all UI elements (such as fields, groups of fields, or sections) that get highlighted when you hover over or select them. The optional changes that you can make on the elements appear in the context menu after you select them. You can also move a UI element by dragging and dropping.

ℹ Note

- Different fields, groups or sections may support different kinds of changes depending on the apps' predefined settings. For example, you can rename one certain field, but for others, you may not be able to rename them.
- You can also make changes on the elements on the popups and dialogues.
- After you add a field that is created in the standard model "gttft1" with Adapt UI, deleting it or marking it unreadable in the standard model will lead to errors and improper display of the field.

Check out the following video for an overview of how to make UI changes:

Open this video in a new window

Moving a UI Element

To move a UI element, just drag and drop it. When you drag a UI element, dashed boxes indicate where you can drop it. Drag the element to its new location (indicated by a space) and drop it.

You can also cut and paste UI elements: Right-click the UI element and choose **Cut** from the context menu. The element gets grayed out and a dashed box indicates where you can paste it. Right-click within the dashed box at the position where you want to paste the cut element and choose **Paste** from the context menu.

Removing a UI Element

Select a UI element it and press Delete or choose **Remove** from the context menu. The element is then removed from the UI, it's not permanently deleted from the app. You can add it again at any point within its original container. Exception: When you delete a group of fields, the grouping information (group title and order of fields) gets lost, but the fields are still available and can be added.

ℹ Note

A UI element container (for example a group) must contain at least one UI element. This means that the **Remove** option is disabled for a UI element if it's the only one in the container. Either add another UI element first or delete the entire container.

You can't remove a field within filter and the worklist settings with this function. If you want to hide some fields within, you can mark them as **Invisible**. For more, see Edit Standard Model Fields.

⚠ Caution

Removing a field does not prevent users from accessing the data associated with the field. The field is merely removed from the UI and no other security measures are applied. If you want to implement security requirements to restrict access to certain data, this has to be done in the back-end system.

Adding a UI Element

Right-click the UI element container where you want to add an element and choose **Add** from the context menu (for example, **Add: Field**). Select the available elements that you want to add and choose **OK**. To add a new group, choose **Create: Group** from the context menu. The following example is provided to show you how to add a UI element: Example: Adding the Events Table.

ℹ Note

In the original app version, under the **Information** tab, you can add standard and core model fields， standard compositions that are not displayed by default.

Renaming a UI Element

You can change editable text of a UI element. If you double-click it and the text (such as the title of a group of fields or a field label) gets highlighted, you can rename it. Just edit the text and press Enter. You can also right-click the element and choose **Rename** from the context menu.

Resetting Changes

By clicking 🗑 in the header bar, you can discard all the UI changes you made and return to the current activated version where you can make the changes again from the start.

Creating a Public View

You can create a view on the worklist page or for tables on the detail page, and make it public so that it's available in users' view list. To do this, select **Public** when you create a view and save. Click **Save & Exit** to exit the **UI Adaptation** mode and return to the running app where you can see the created view in your view list.

Embedding Content

Currently, this is not supported in fulfillment tracking apps.

Example: Adding the Events Table

This section gives you step-by-step instructions on how to add a UI element using the example of adding the **Events** table in the Track Shipments app. So, you can add other elements in the same way, such as user-defined tracking status tag, user-defined group on the header, fields in the **Information** section, and so on. Before you start, make sure that you have added the ""FlexKeyUser" role to your role collection mentioned in the ***Prerequisites*** section of Adapting the UI.

Context

To add the **Events** table in the Track Shipments app, do the following:

Procedure

1. Launch the TS app.
2. Click one of the shipments to go to the **Shipment Details** page.
3. Choose **Adapt UI** from the user actions menu. Now you are in the **UI Adaptation** mode.
4. Click one of the tabs to show the context menu with available action options.

   Note

   Generally, the UI element that you want to add must be of the same type with the one you click in this step. If you want to add a user-defined group on the header, you should click one of the existing group there. If you want to add the tracking status tag, click one of the existing tag, such as delay status tag.

5. Click the Add icon.
6. Choose **Events** from the available content in the pop-up and click **OK**.
7. Activate the new version:
   a. Click icon on the top left of the page
   b. Enter a name for the new version and confirm
8. Click **Save & Exit** on the top right of the page.

Results

The **Events** tab with a table in it is added to the right of the tab you clicked. You can change its position by dragging and dropping.

Navigate to Fulfillment Tracking Apps from External Systems

SAP Business Network Global Track and Trace supports navigation from external systems to worklist pages and detail pages of fulfillment tracking apps.

If you want to navigate to worklist pages, see Navigate to Worklist Pages of Fulfillment Tracking Apps from External Systems.

If you want to navigate to detail pages, see Navigate to Detail Pages of Fulfillment Tracking Apps from External Systems.

Navigate to Worklist Pages of Fulfillment Tracking Apps from External Systems
