In CPC any of these options can be used to set up tracking with the Network Partner.

These options relate to how a Network Partner wishes to track and also how a Business partner is set up in TM by the shipper.

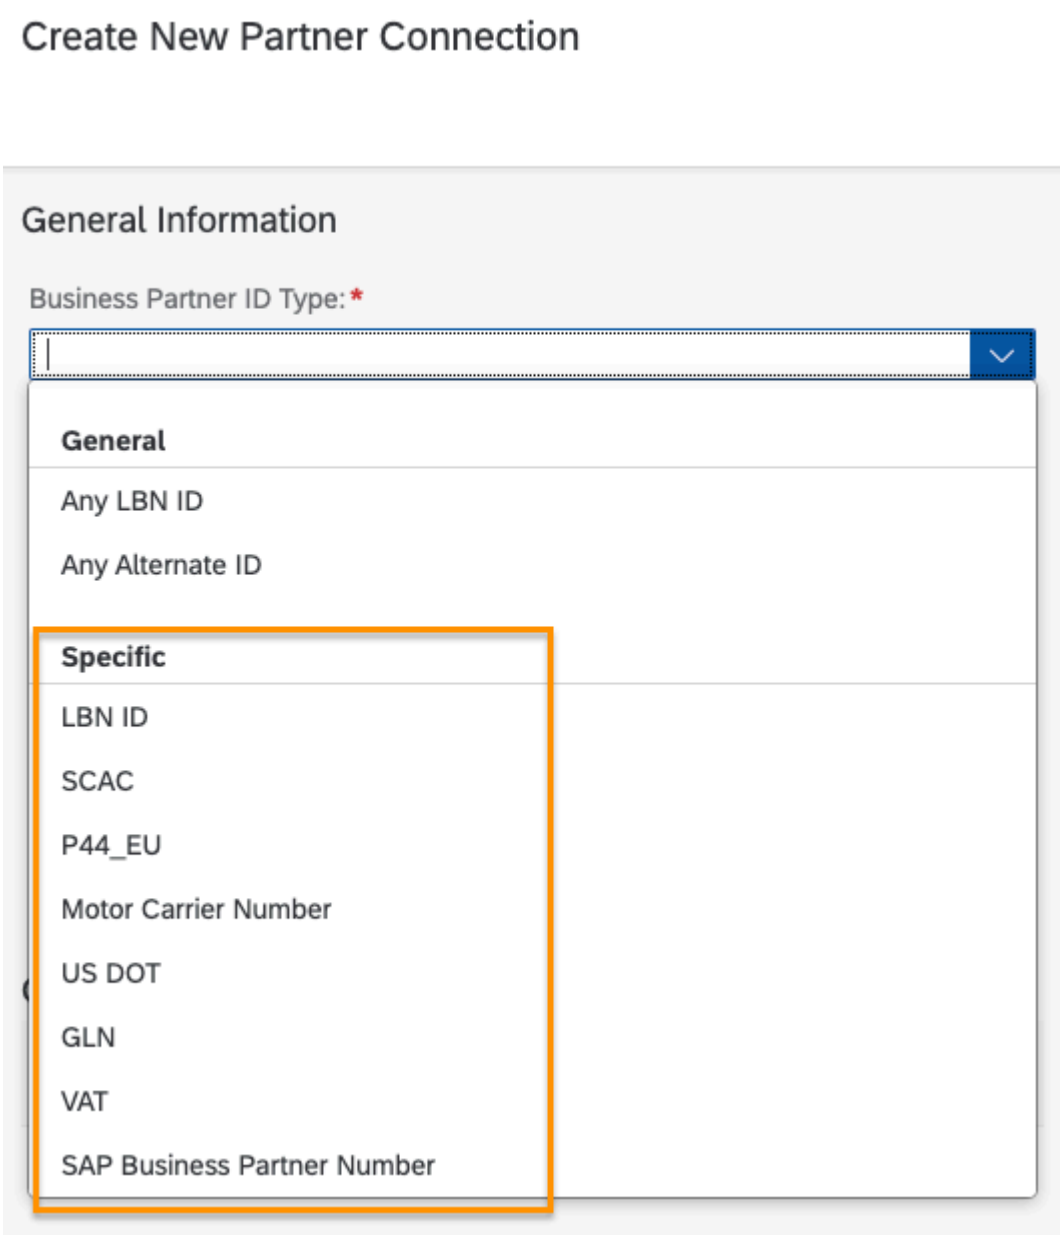

Example 1: If a shipper wants to utilize a visibility provider's tracking services for all their shipments and assuming that all the carriers the shipper is doing business with are not onboarded to BNL, but have an alternate ID in the shipper's TM the below pattern can be used.

Example 2:

If a shipper has more than one visibility provider and wants to utilize their tracking services for their shipments and assuming that all the carriers the shipper is doing business with are not onboarded to BNL, but they do have a specific alternate ID in the shipper's TM, the below pattern can be used.

Here, the shipper will have to identify a specific alternate ID using which they can distinguish the orders being sent to specific visibility providers.

Depending on the supportability of the network partner, appropriate service can be configured.

Note: The payload examples shown above are only focused on sending and receiving the right business partner details. For detailed payload structure, refer the specifications for Freight Collaboration and Global Track and Trace.

What should be the strategy with Network Partners?

This blog shows the supportability of the solution, the different variations, and how the APIs behave when a Network Partner is involved. It is important to determine the right strategy that works for a shipper. To do that, the below questions need to be answered as part of designing the solution.

1. What scenarios are in scope for the Shipper-Carrier/LSP-Network Partner trio?

2. Are all carriers/LSPs in scope also in scope of the Network Partner? Is there a direct B2B connectivity scenario with one or more carriers / LSPs?

3. How is the Business Partner setup done across the components - SAP TM / S/4HANA, SAP Business Network for Logistics, and in the Network Partner's system?

4. What are the common identifiers across these components?

So, it is imperative to have a design that answers the above, and then a suitable approach or a combination of approaches can then be deployed.

Product and Topic Expert

Both very detailed and very clear Thank you for this.

This strategy and process for connecting a logistics ecosystem is very helpful for both shippers and carriers to understand.
