THE BEST RUN SAP®

INTRODUCTION

Note: As of today, SAP Business Network Freight Collaboration supports the following B2B standards and corresponding messages:

EDI/B2B Message Standard	Message Type	Version	Description
EDIFACT	IFTMIN	D96A	Instruction messages, submitting shipment to carriers
EDIFACT	IFTSTA	D01C	Status report messages, receiving status updates for shippers from carriers
EDIFACT	IFTMBC	D96A	Booking confirmation message
EDIFACT	INVOIC	D96A	Invoice Message

To set up EDIFACT integration, an SFTP connection needs to be configured in the *System Connections* app. This implementation guide describes in detail what you need to do.

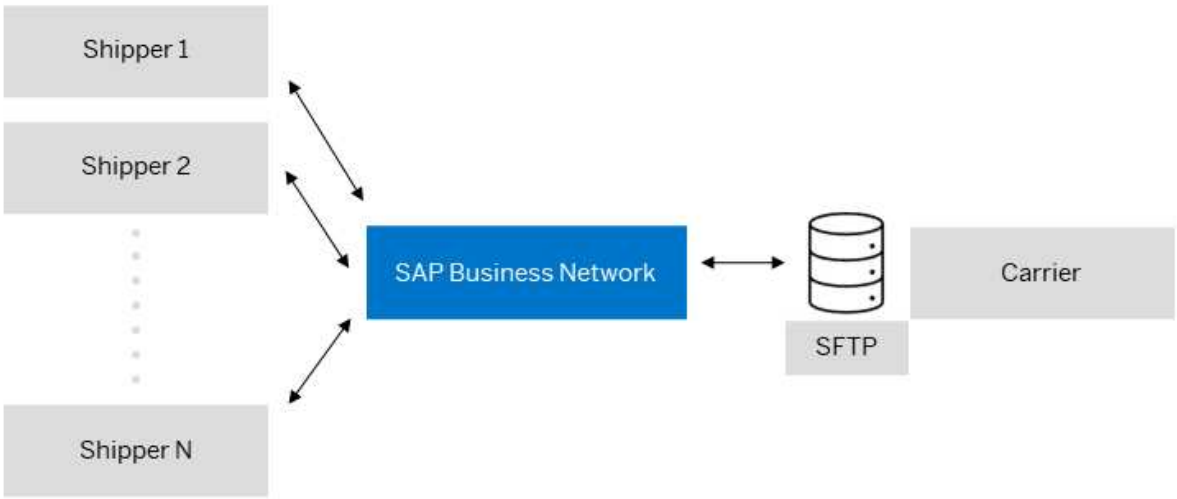

Note: All activities mentioned in this guide have to be done in both the test and productive environments.

PREREQUISITES

To set up EDI integration with SAP Business Network for Logistics, you must meet the following requirements:

- Carrier tenant is available in the test and productive environments. For more information about the process of registering SAP Business Network for Logistics, activating your account, logging on, and adding users, see the Activate Your Account guide.
- Carrier must maintain alternate identifiers (such as the GLN in the *Manage Business Profile* app. The GLN is essential for identification of the carrier. For more information, see Edit Company Profile.
- In case your SFTP server uses IP filtering, you need to add specific IP ranges to the allow list based on the data center you're onboarded to. Otherwise, the Cloud Integration tenants cannot connect to your SFTP server. For more information, see Regions and Hosts Available for the Connectivity Platform | SAP Help Portal.
- It is expected from a carrier to set up an SFTP server on their side for information exchange. Carriers have to set up the SFTP connection once and shippers can use the same SFTP connection for communication. Carriers must enter a base64-encoded string of their SFTP server in the *Known Host Key* field of the *System Connections* app. See also Specifying the Authentication Details and Base URLs for Your System's Endpoints.

  The following diagram demonstrates the SFTP communication between the involved parties.

- Ensure that you use different folders for *Test* and *Prod* on your SFTP server.

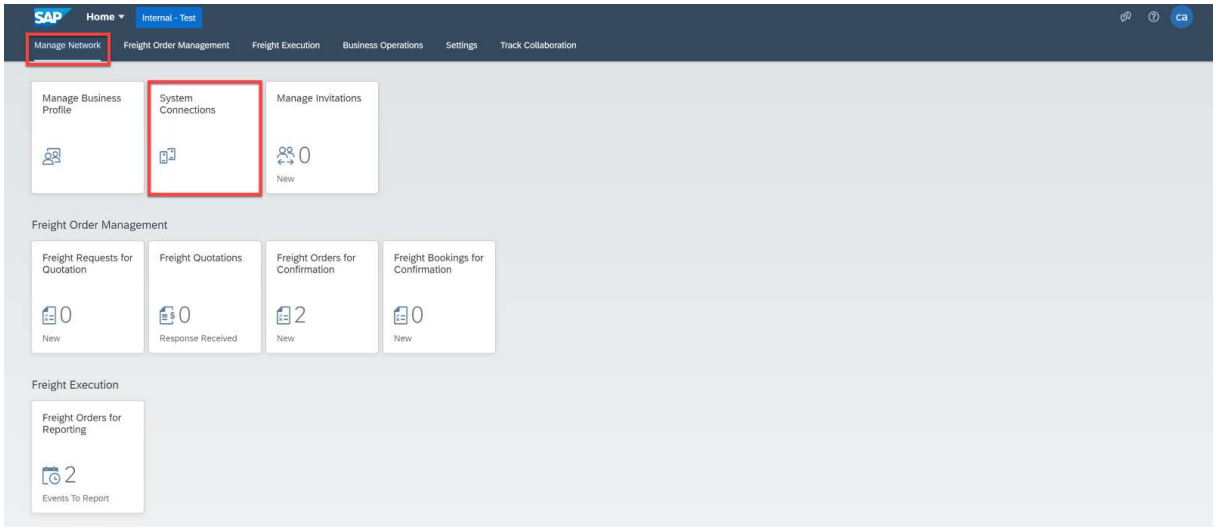

PROCESS DESCRIPTION

The process flow below illustrates a sequence of events for exchanging UN/EDIFACT messages which are supported by SAP Business Network for Logistics. The supported message types are also listed in the *Introduction* section.

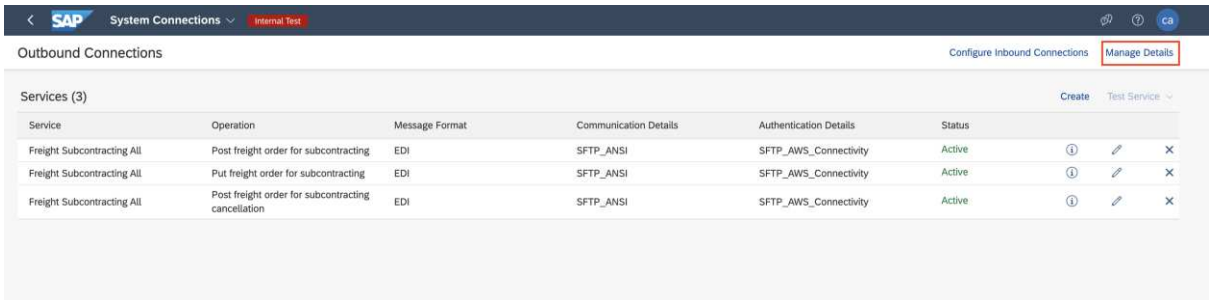

STEP 1: IFTMIN (OUTBOUND)

On the *Manage Network* tab of your SAP Fiori launchpad, select the *System Connections* app.

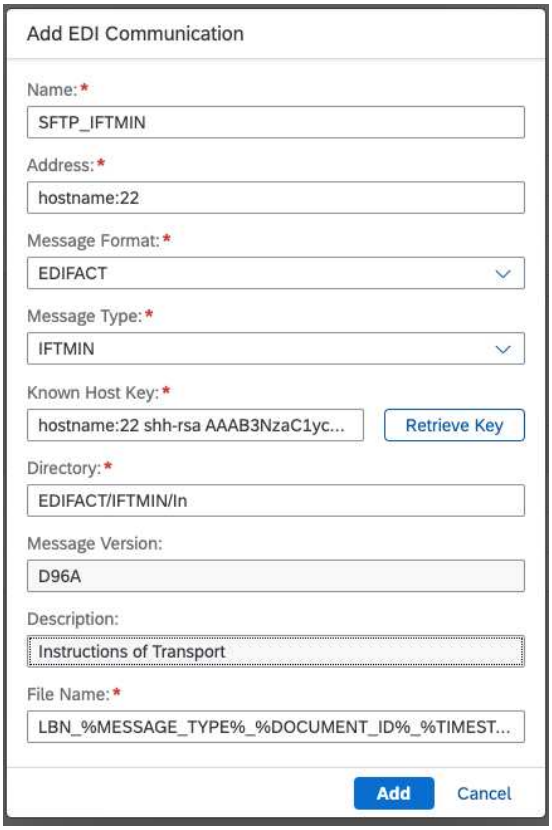

Choose *Manage Details* in the upper-right corner.

Under the *Communication Details* tab, choose *Add* and select the SFTP option from the dropdown menu.

Enter the following data in the *Add EDI Communication* window:

For more information, see Specifying the Authentication Details and Base URLs for Your System's Endpoints.

Hint: The file name can consist of particular placeholders that you replace when creating the file name and fixed parts. For example, LBN_%DOCUMENT_ID%_%TIMESTAMP%.edi

Available placeholders:

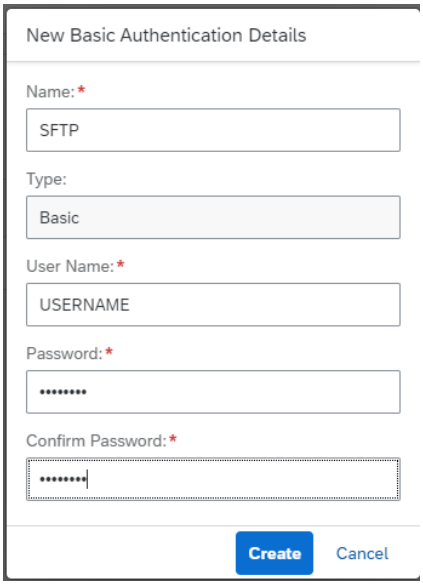

- %DOCUMENT_ID%
- %MESSAGE_TYPE%
- %TIMESTAMP%
- %SHIPPER_LBN_ID%

In addition, for the EDI 997 message, the placeholder %CONTROL_NUMBER% is available to be used as a unique ID referring to each ST/SE transaction in LBN inbound message containing multiple transactions.

Under the *Authentication Details* tab, choose *Add* and select the BASIC option from the dropdown menu.

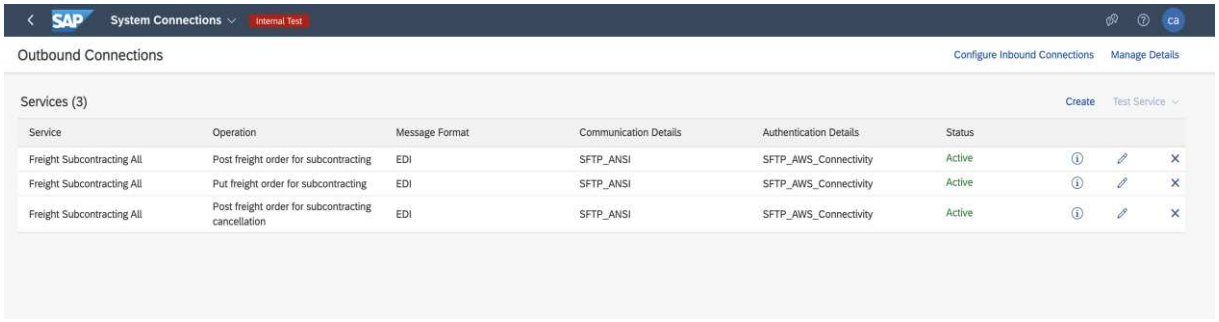

Enter the following data in the *New Basic Authentication Details* window:

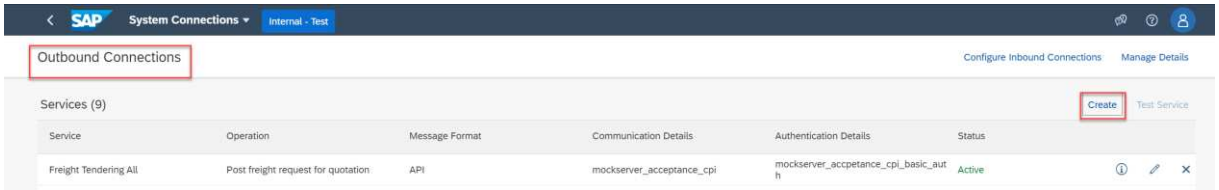

Go back to the entry page of the *System Connections* app and create three different outbound connections for the *Freight Subcontracting All* service, one for each of the following operations:

- Post freight order for subcontracting cancellation
- Post freight order for subcontracting
- Put freight order for subcontracting

To do so, create a new service:

Enter the following data for the new service:

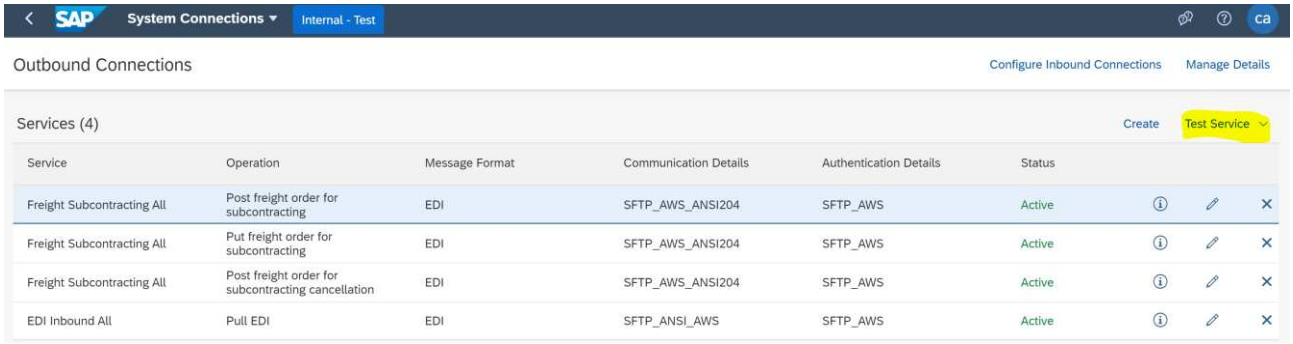

Repeat these steps for each of the following operations for the *Freight Subcontracting All* Service:

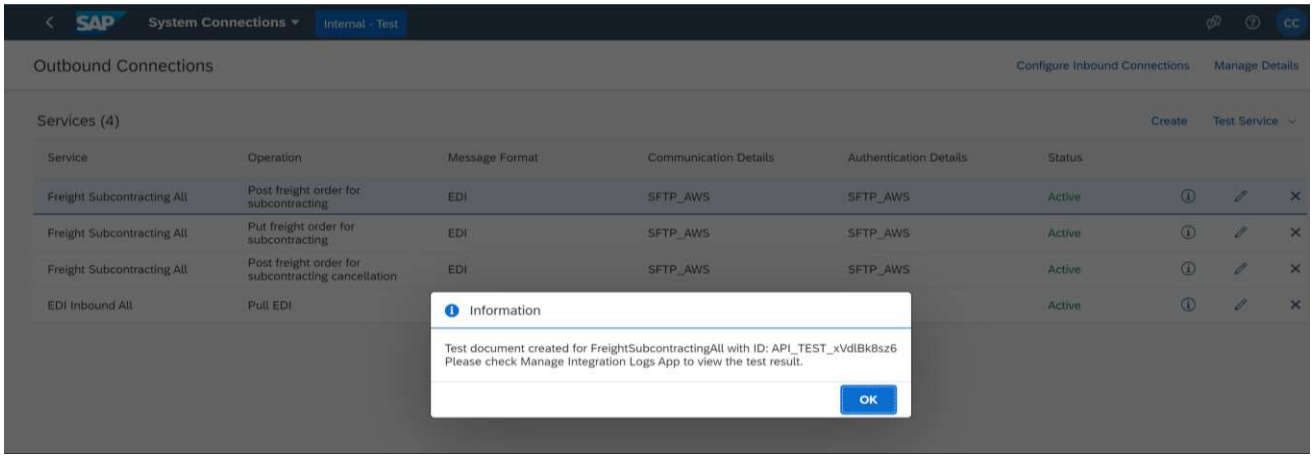

- Post freight order for subcontracting cancellation
- Post freight order for subcontracting
- Put freight order for subcontracting

STEP 2: TEST OUTBOUND CONNECTIVITY

After configuration, you should directly perform a connection test to your SFTP server. To test the service, in the *Services* table, select *Post freight order for subcontracting* and choose *Test Service* in the upper-right corner, then select *With Default Payload*:

The system generates a test freight order and attempts to send a 204 file to your SFTP server. The below window is shown with the test freight order ID:

Using the ID of the created document (for example API_TEST_xVdlBk8sz6), open the *Manage Integration Logs* app to view the test result. Please refer to the chapter OPERATIONAL MONITORING for more details.
