- Multi-factor authentication (MFA) and IP whitelisting

  These are available but disabled by default. These can be enabled at the tenant-level on request.

- Encryption

  All transactional data is encrypted both at rest and in transit.

- Credential security

  Credentials are encrypted or hashed according to industry best practices.

If a data breach occurs due to a leaked carrier account, who is responsible for handling the situation?

In case of a data breach, or any other security incident in the carrier tenants, the carriers are the data owners. They will be responsible for handling these situations, with the necessary support from SAP Business Network for Logistics.

What support does SAP provide in case of a security breach?

Carriers can raise a support ticket in SAP Business Network for Logistics. Depending on the nature of the breach, the following actions can be taken:

- Disabling compromised API credentials and issue new ones.
- Blocking unauthorized user access.
- Restoring tenant access if valid users lose access due to security issues.
- Disabling the connection between the shipper and carrier temporarily to isolate the shipper system from the affected system.
