THE BEST RUN SAP®

INTRODUCTION

Note: As of today, SAP Business Network Global Track and Trace (GTT) supports the following B2B standards and corresponding messages:

EDI/B2B Message Standard	Message Type	Version	Description
EDIFACT	IFTSTA	D01C	Shipment Status Inquiry
EDIFACT	IFTSTA	D01C	Shipment status Update

EDIFACT IFTSTA supports both inquiries of shipment status and responses for the status of a consignment, making it suitable for use in both inbound and outbound connections. To set up EDIFACT integration for the IFTSTA message type, you, as a data contributor, must configure an SFTP connection in the *System Connections* app. Additionally, the GLNID for both parties (solution owner and data contributor) must be consistently maintained in the *Configure Partner Connections* and *System Connections*. This implementation guide provides detailed instructions on what needs to be done.

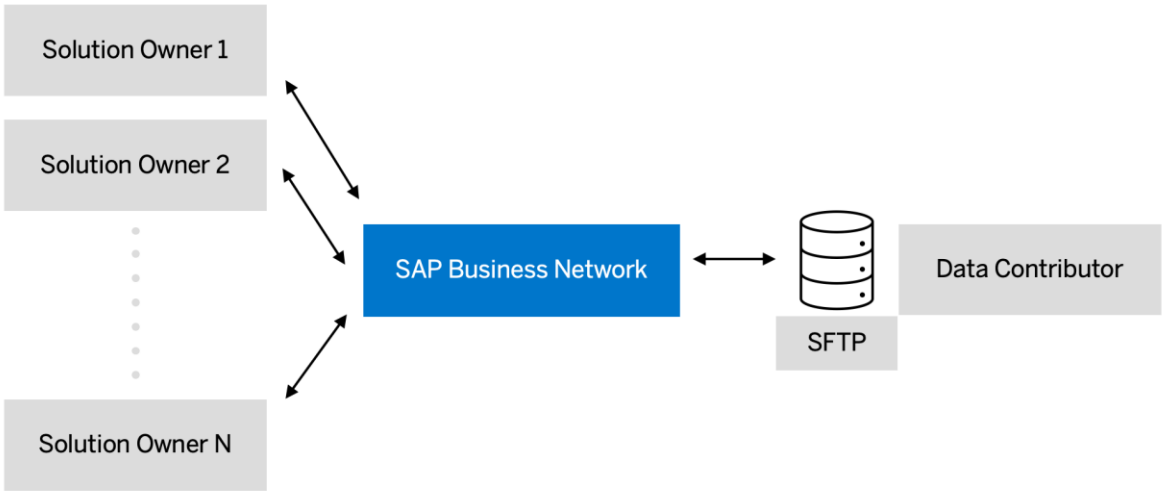

Note: We strongly recommend that you perform all activities mentioned in this guide in both the test and productive environments.

PREREQUISITES

To set up EDI integration with SAP Business Network for Logistics, you must meet the following requirements:

- The data contributor tenant is available in the test and productive environments. For more information about the process of registering SAP Business Network for Logistics, activating your account, logging on, and adding users, see the Activate Your Account guide.
- Both the solution owner and data contributor must maintain alternate identifiers (such as the GLNID in the **System Connections** app. The GLNID is crucial for identifying both parties in IFTSTA communication. For more information, see Manage Alternate IDs (Data Contributor) | SAP Help Portal.
- The solution owner you work with has maintained the GLNID of both parties in the **Configure Partner Connections** app. For more information, see Enable EDIFACT IFTSTA for Event Tracking.
- In case your SFTP server uses IP filtering, you need to add specific IP ranges to the allow list based on the data center you're onboarded to. Otherwise, the Cloud Integration tenants cannot connect to your SFTP server. For more information, see Regions and Hosts Available for the Connectivity Platform.
- It is expected that data contributor set up an SFTP server on their side for information exchange. Data contributors have to set up the SFTP connection once and solution owners can use the same SFTP connection for communication. Data contributors must enter a base64-encoded string of their SFTP server in the *Known Host Key* field of the *System Connections* app. See also Specifying the Authentication Details and Base URLs for Your System's Endpoints.

  The following diagram demonstrates the SFTP communication between the involved parties.

- Ensure that you use different folders for *Test* and *Prod* on your SFTP server.

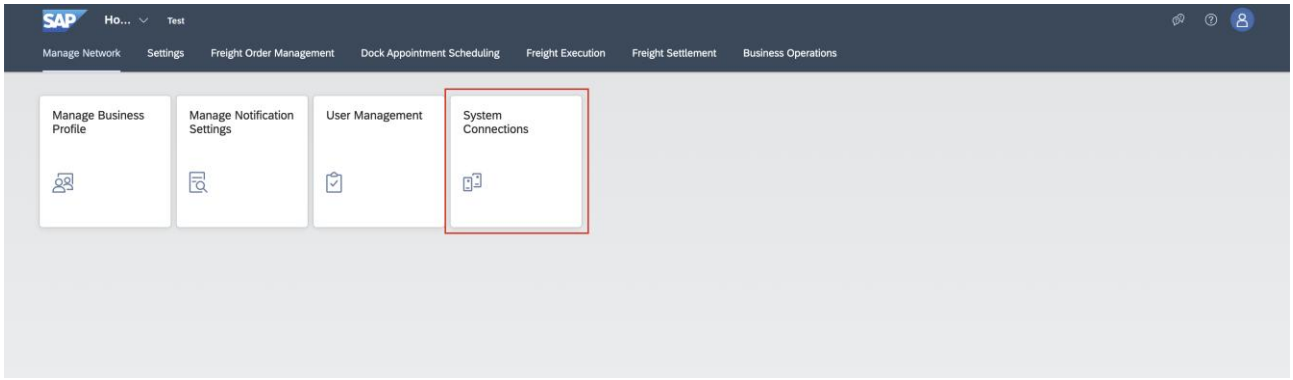

PROCESS DESCRIPTION

The process flow below illustrates a sequence of events for exchanging UN/EDIFACT messages which are supported by SAP Business Network for Logistics. The supported message types are also listed in the *Introduction* section.

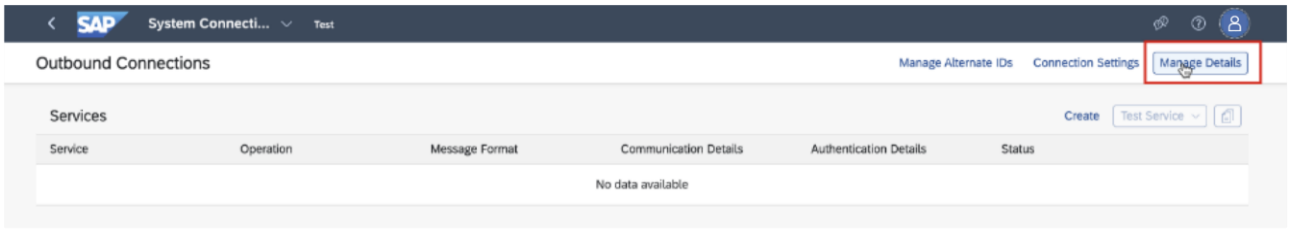

STEP 1: IFTSTA (OUTBOUND)

On the *Manage Network* tab of your SAP Fiori launchpad, select the *System Connections* app.

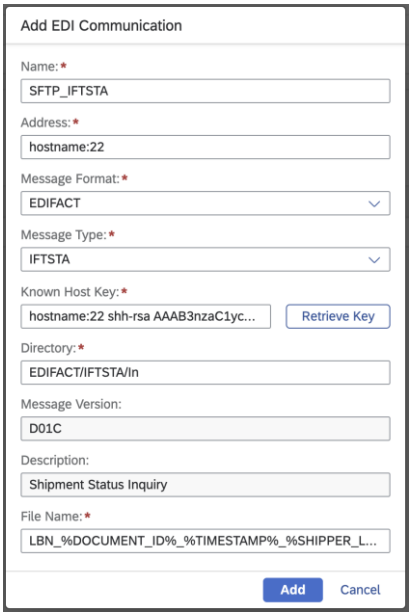

Choose *Manage Details* in the upper-right corner.

Under the *Communication Details* tab, choose *Add* and select the SFTP option from the dropdown menu.

Enter the following data in the *Add EDI Communication* window:

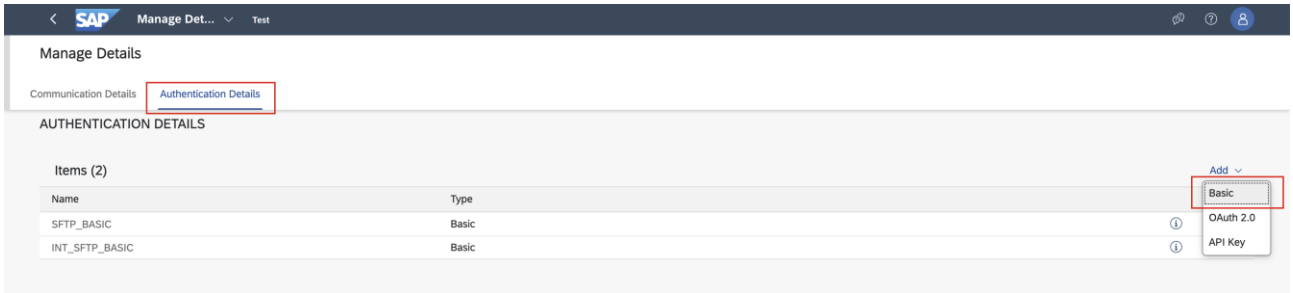

For more information, see Specifying the Authentication Details and Base URLs for Your System's Endpoints.

Hint: The file name can consist of particular placeholders that you replace when creating the file name and fixed parts. For example, LBN_%DOCUMENT_ID%_%TIMESTAMP%.edi

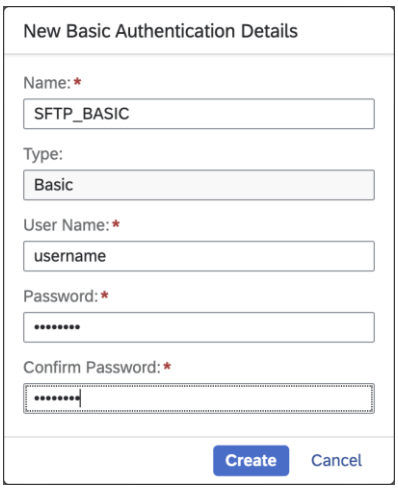

Available placeholders:

- %DOCUMENT_ID%
- %MESSAGE_TYPE%
- %TIMESTAMP%
- %SHIPPER_LBN_ID%

Under the *Authentication Details* tab, choose *Add* and select the BASIC option from the dropdown menu.

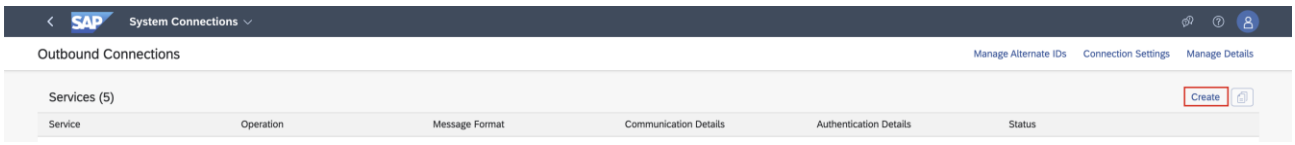

Enter the following data in the *New Basic Authentication Details* window:

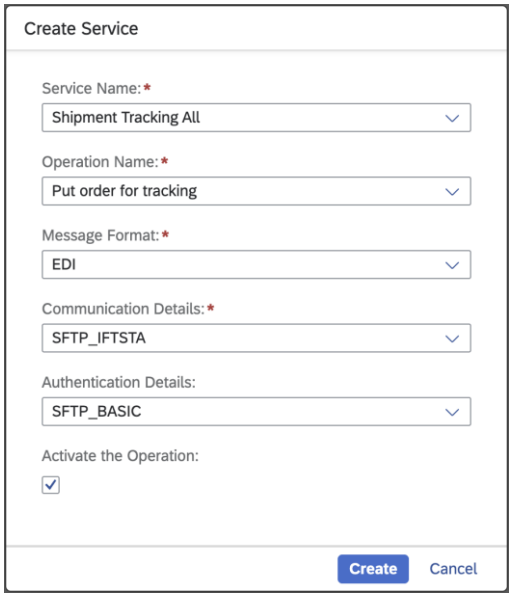

Go back to the entry page of the *System Connections* app and create outbound connection for the following service and operation

Service	Operation	Corresponding EDIFACT Message
Shipment Tracking All	Put order for tracking	EDIFACT IFTSTA

To do so, create a new service:

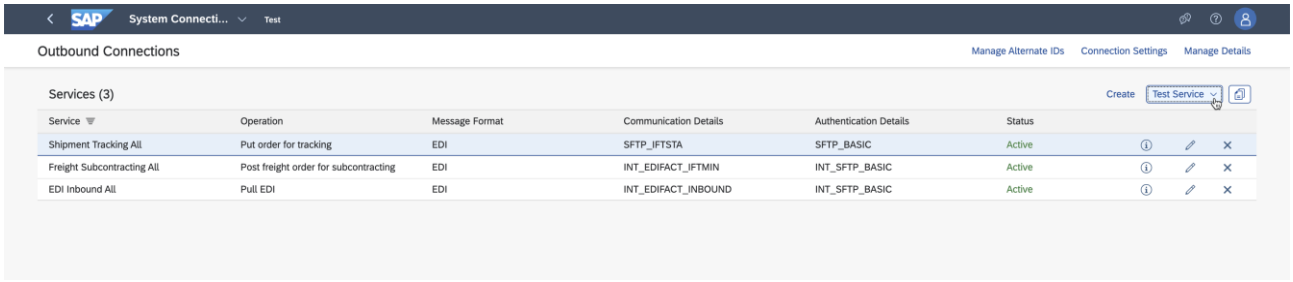

Enter the following data for the new service:

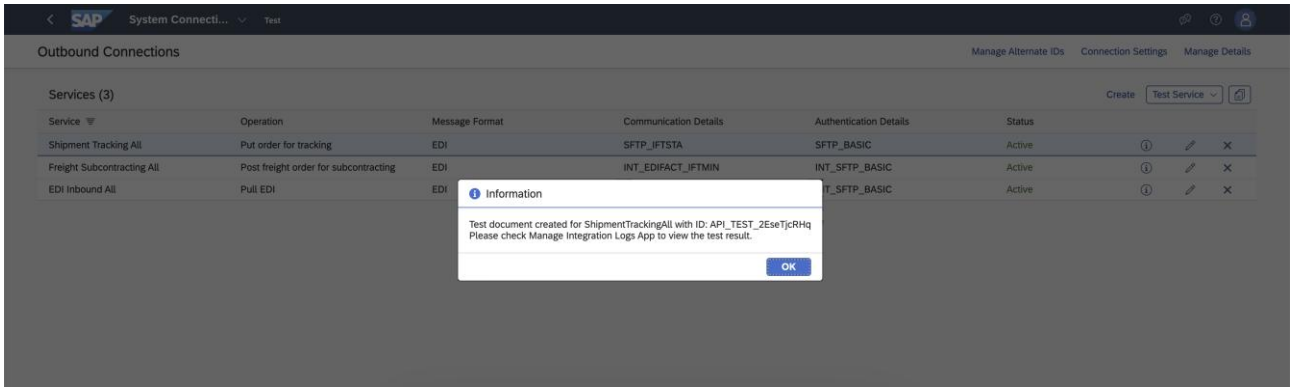

STEP 2: TEST OUTBOUND CONNECTIVITY

After configuring the outbound connection, you should directly perform a connection test to your SFTP server. To test the service, select *Shipment Tracking All* from the Service table and choose *Test Service* in the upper-right corner, then select *With Default Payload*:

The system generates a test freight order and attempts to send an EDI file to your SFTP server. The following window is shown with the test freight order ID:

Using the ID of the created document (for example API_TEST_2EseTjcRHq), you can find the corresponding test document in the *Manage Integration Logs* app and view the test result. Please refer to the chapter OPERATIONAL MONITORING for more details.

STEP 3: IFTSTA (INBOUND) WITH SFTP POLLING

On the *Manage Network* tab of your SAP Fiori launchpad, select the *System Connections* app.
